NB LINEAR SYSTEMS

The NB linear systems is a linear motion mechanism which utilizes the rolling motion of ball and/or roller elements. NB offers a wide range of linear motion products of high precision quality that contribute to the size and weight reduction of machinery and equipment.

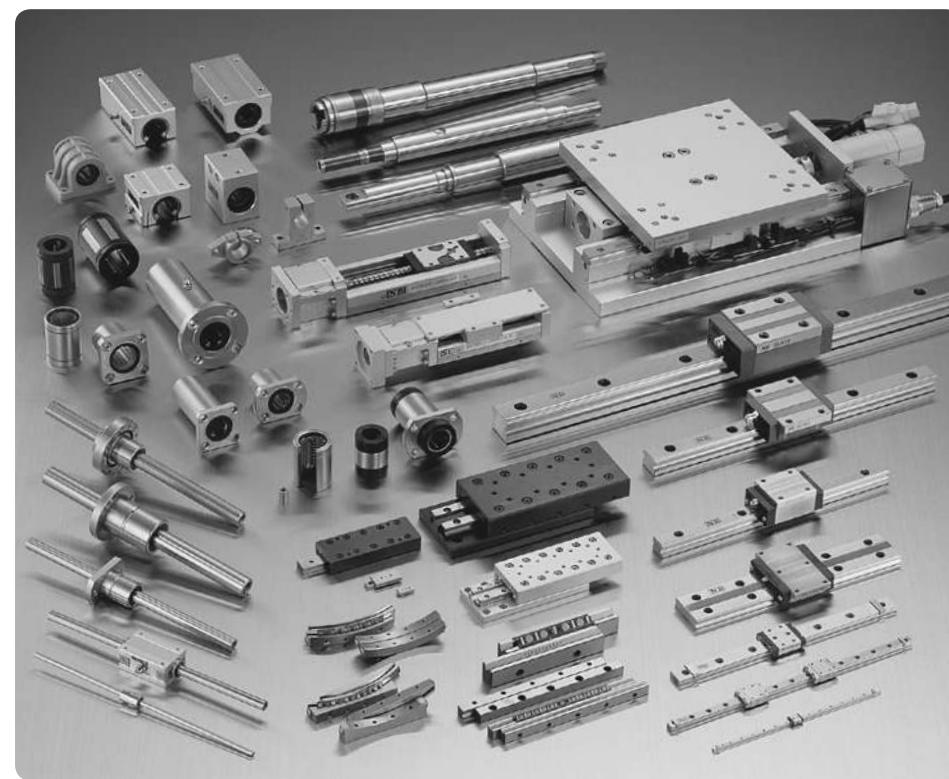

ADVANTAGES

Low Friction and Excellent Response

The dynamic friction of the ball or roller elements is substantially lower than that of full-face surface sliding friction. Since the difference between dynamic and static frictional resistance is small, motion response is excellent in terms of positioning accuracy and in high speed applications with acceleration and deceleration.

High Precision and Smooth Movement

The NB linear systems is designed for the rolling elements to achieve extremely smooth motion. The raceway surface is finished by precision grinding for high precision movement with optimal clearance.

High Load Capacity and Long Travel Life

Despite the compactness of the NB linear systems, the system uses relatively large rolling elements on a long raceway resulting in a high load capacity and a long travel life.

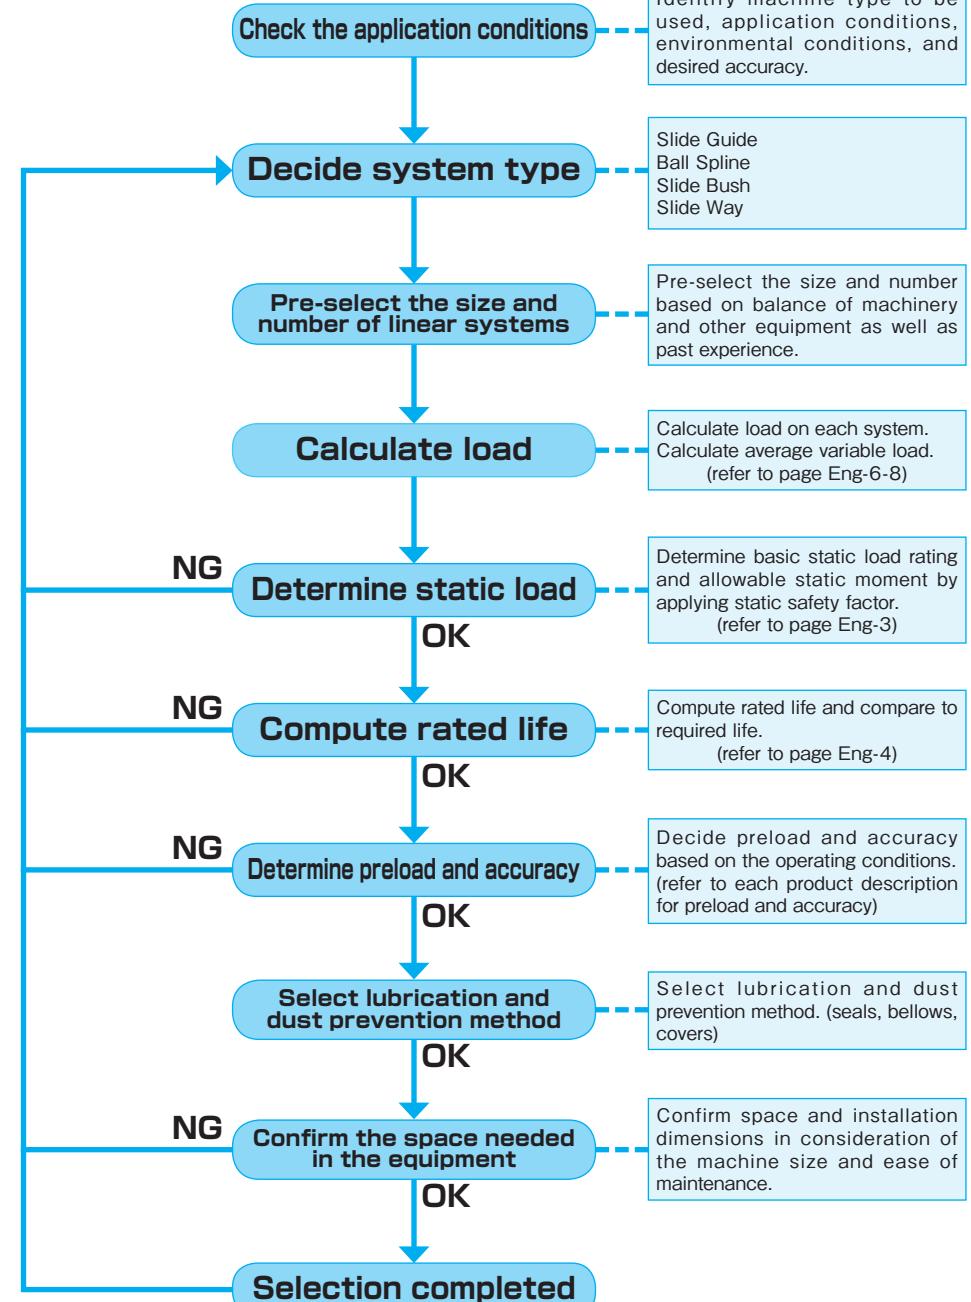

Ease of Installation

The NB linear systems shortens machining and assembly time compared with that of a full-face surface sliding bearing.

Variety of Types

A wide variety of types and sizes of the NB linear systems are available to best serve the purpose for every application and requirement.

PROCESS FOR SELECTING NB LINEAR SYSTEMS

ALLOWABLE LOAD

Load and Moment

A load is applied to the linear systems as Figure 1-1 shows. Sometimes moment loads are applied to, for example, slide guides. Load and moment are defined as follows.

Basic Static Load Rating (compliant with ISO14728-2^{*1}) and Allowable Static Moment

When excess load or impact load is applied to the linear systems while it is stationary or moving slowly, a permanent deformation occurs on the rolling elements and the race way.

If this deformation exceeds a certain limit, it causes vibration and noise during operation resulting in a non-smooth motion and a shorter life time. To prevent this permanent deformation and deterioration in motion accuracy, the basic static load rating (C_0) is given as the allowable load for the linear systems. This basic static load rating is defined as the static load that results in the maximum allowable stress at the center of the contact surface between the rolling elements and the race way. The sum of the permanent deformation of the rolling element and that of the race way is 0.0001 times the diameter of the rolling element. In the linear systems, a moment load may be present in addition to the static load. The allowable static moments are defined by M_P , M_Y , and M_R as illustrated in Figure 1-1.

*1: This does not apply to some products.

Allowable Load and Static Safety Factor

The basic static load rating and allowable static moment define the maximum static load in each direction, however, these maximum static loads are not necessarily applicable depending on the operating conditions, the mounting accuracy, and the required motion accuracy. Therefore, an allowable load with a safety factor must be obtained. The minimum static safety factor is listed in Table 1-1.

Allowable Load

$$P_{\max} \leq C_0/f_s \quad \dots \dots \dots (1)$$

Allowable Moment

$$M_{\max} \leq (M_P, M_Y, M_R, M_{P2}, M_{Y2})/f_s \quad \dots \dots \dots (2)$$

f_s : static safety factor C_0 : basic static load rating (N)

P_{\max} : allowable load (N)

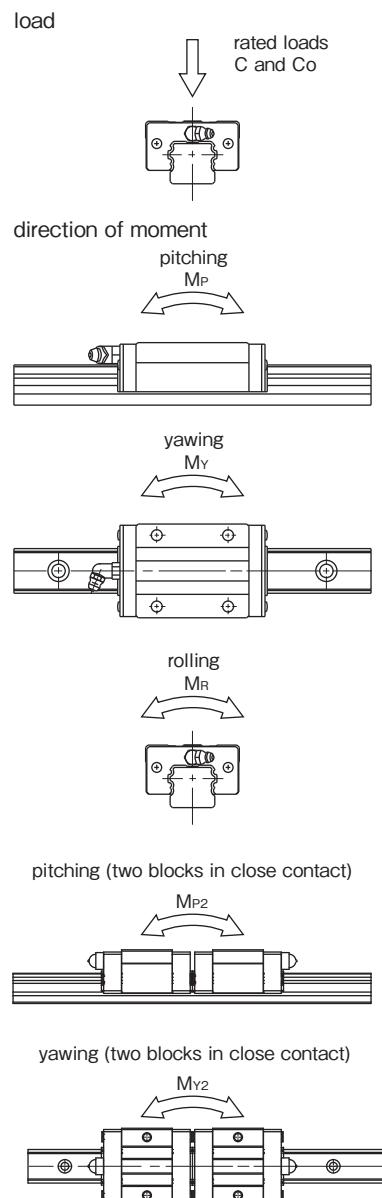

$M_P, M_R, M_Y, M_{P2}, M_{Y2}$: allowable static moment (N · m)

M_{\max} : allowable moment (N · m)

Table 1-1 Minimum Static Safety Factor (f_s)

operating conditions	static safety factor
normal	1~2
smooth motion required	2~4
vibration/impact loading	3~5

Figure 1-1 Load and Moment

LIFE

Life of a Linear Systems

When a linear systems reciprocates under loading, a continuous stress acts on it, ultimately causing flaking of its race way surface due to material fatigue. The distance a linear system travels before this flaking occurs is defined as the life of the linear system. A linear systems can also become inoperable due to sintering, cracking, pitting, or rusting, however, these causes are differentiated from flaking because they are related to installation accuracy, operating environment, and relubrication method.

Rated Life

Even when a group of linear systems from the same production lot operated under identical conditions, the life time can differ due to differences in the material fatigue failure characteristics. This fact prevents from determining the exact life time of a single linear systems for use. Therefore, the rated life is defined statistically as the distance of 90% of the linear systems travel before causing flaking.

Basic Dynamic Load Rating (compliant with ISO14728-1^{*2}) and Basic Dynamic Torque Rating

The life of a linear systems is expressed in terms of the distance traveled. Therefore, the life of a linear systems is calculated reversely by using the allowable load that achieves a certain travel distance. This allowable load is called the basic dynamic load rating. The basic dynamic load rating is defined as a constant load in weight and direction that can achieve a travel distance of 50×10^3 m on the linear systems. NB assumes the load is applied from the top as a normal radial load, because basic dynamic load ratings change depending on the applied load direction. The basic dynamic load ratings in the dimensional tables are based on this assumption. Ball splines can carry torque loading, so the basic dynamic torque rating is defined for the Ball Spline.

*2: This does not apply to some products.

Rated Life Estimation

The rated life estimation depends on the type of the rolling element. Equations (3) and (4) are used for the ball element and for the roller element, respectively. Equation (5) is used when torque loading is present.

balls are used as the rolling element

$$L = \left(\frac{C}{P} \right)^3 \cdot 50 \quad \dots \dots \dots (3)$$

rollers are used as the rolling element

$$L = \left(\frac{C}{P} \right)^{10/3} \cdot 50 \quad \dots \dots \dots (4)$$

torque loading is present

$$L = \left(\frac{C_T}{T} \right)^3 \cdot 50 \quad \dots \dots \dots (5)$$

L: rated life (km) C: basic dynamic load rating (N)

P: applied load (N) C_T: basic dynamic torque rating (N · m)

T: applied torque (N · m)

In the actual application, numerous variable factors are present such as in guide rail/shaft accuracy, in mounting conditions, in operating conditions, vibration and shock, etc. Therefore, calculating the actual applied load accurately is extremely difficult. In general, the calculation is simplified by using coefficients representing these factors: hardness coefficient (f_H), temperature coefficient (f_T), contact coefficient (f_C), and applied load coefficient (f_w). Taking these coefficients into account, Equations (3) to (5) become Equations (6) to (8).

balls are used as the rolling element

$$L = \left(\frac{f_H \cdot f_T \cdot f_C \cdot C}{f_w P} \right)^3 \cdot 50 \quad \dots \dots \dots (6)$$

rollers are used as the rolling element

$$L = \left(\frac{f_H \cdot f_T \cdot f_C \cdot C}{f_w P} \right)^{10/3} \cdot 50 \quad \dots \dots \dots (7)$$

torque loading is present

$$L = \left(\frac{f_H \cdot f_T \cdot f_C \cdot C_T}{f_w T} \right)^3 \cdot 50 \quad \dots \dots \dots (8)$$

L: rated life (km) f_H: hardness coefficient

f_T: temperature coefficient f_C: contact coefficient

f_w: applied load coefficient P: applied load (N)

C: basic dynamic load rating (N)

C_T: basic dynamic torque rating (N · m)

T: applied torque (N · m)

When the travel distance per unit time is constant, the rated life can be expressed in terms of time (hour). Equation (9) shows the relationship between stroke length, number of cycles per minute, and the life time.

• Hardness Coefficient (f_H)

In the linear systems, the guide rail or shaft works as race way of the rolling elements. Therefore, the hardness of the rail or shaft is an important factor in determining the rated load. The rated load decreases as the hardness decrease below 58HRC. NB products hold appropriate hardness by advanced heat treatment technology. In case of using the rail or shaft of insufficient hardness, please take the hardness coefficient (Figure 1-2) into the life calculation equation.

• Temperature Coefficient (f_T)

In order to give low wear characteristics NB products are hardened by heat treatment. If the temperature of the linear systems exceeds 100°C, the hardness is decreased by tempering effect, so as the rated load decreases. Figure 1-3 shows the temperature coefficient as hardness changes with temperature.

• Contact Coefficient (f_c)

When more than one bearing is used in close contact, the contact coefficient should be taken into consideration due to the variation of products and the accuracy of the mounting surface. Table 1-2 shows the contact coefficient for life calculation.

• Applied Load Coefficient (f_w)

The actual applied load on a liner system can be greater than the calculated load due to impact, vibration, or inertia. Hence, an appropriate applied load coefficient(table 1-3) must be incorporated into a life calculation.

There are separate applied load coefficient tables for TOPBALL products on page D-4.

$$L_h = \frac{L \cdot 10^3}{2 \cdot \ell_s \cdot n_1 \cdot 60} \dots \dots \dots \quad (9)$$

L_h : life time (hr) l_s : stroke length (m)
 n_l : number of cycles per minute (cpm)

• Equivalent Coefficient

The linear systems are generally used with two axes, each axis with a couple of bearings installed. However, due to a space limitation, there must be an application in which one axis with one or two bearings in close contact installed. In such a case, multiply the applied moment by the equivalent moment coefficient shown in Tables 1-7~1-25 for applied load calculation. The following is a formula for calculating the equivalent moment load when a moment is applied to the linear systems.

$$P = E \cdot M$$

P: equivalent moment load per bearing (N)
 E: equivalent moment coefficient
 M: applied moment (N · mm)

Calculation of Applied Load (2)

Table 1-6 shows the formulas for determining the applied load when moment is applied to the linear systems.

W: applied load (N) P: load applied to the linear system (N) l: distance to applied load or to working center of gravity (mm)

Table 1-6 Applied Load Calculation (3)

Average Applied Load

The load applied to a linear systems generally varies with the travel distance depending on how the system is operated. This includes the start/stop processes of the reciprocating motion and work on the system. The average applied load is used to compute the life corresponding to the actual application conditions.

- ① When the load varies in a step manner with the travel distance (Figure 1-7).

 ℓ_1 is the travel distance under load P₁ ℓ_2 is the travel distance under load P₂

⋮

 ℓ_n is the travel distance under load P_n

The average applied load P_m is obtained by the following equation.

$$P_m = \frac{1}{\ell} (P_1^3 \ell_1 + P_2^3 \ell_2 + \dots + P_n^3 \ell_n) \quad \dots \quad (10)$$

P_m: average applied load (N) ℓ : total travel distance (m)

Figure 1-7 Applied Load Varies Stepwise

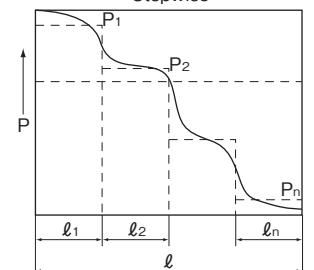

Figure 1-8 Applied Load Varies Linearly

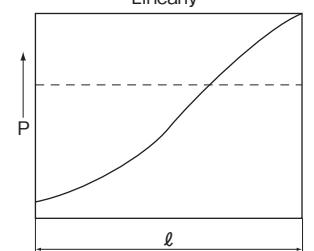

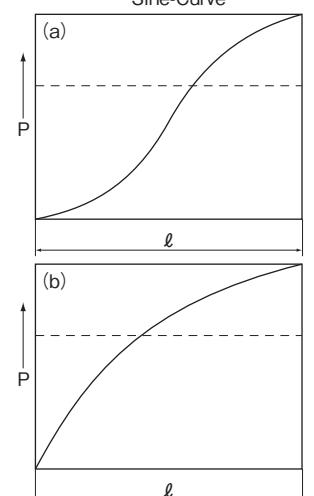

Figure 1-9 Applied Load Varies Sine-Curve

- ② When the applied load varies linearly with the travel distance (Figure 1-8), the average applied load P_m is approximated by the following equation.

$$P_m = \frac{1}{3} (P_{min} + 2P_{max}) \quad \dots \quad (11)$$

P_{min}: minimum applied load (N)P_{max}: maximum applied load (N)

- ③ When the applied load draws a sine-curve as shown by Figures 1-9 (a) and (b), the average applied load P_m is approximated by the following equations.

$$P_m = 0.65P_{max} \quad \dots \quad (12)$$

$$P_m = 0.75P_{max} \quad \dots \quad (13)$$

In case that some external force is applied to the system, please refer to "Slide Guide Travel Life Calculation Program" at NB website.

① Calculating Moment Applied to the Unit

<acceleration>

$$\text{pitching } Ma_1 = m \cdot g \cdot X_m - m \cdot a_1 \cdot (Z_m - Z_d)$$

$$Ma_1 = 30 \times 9.8 \times (15) - 30 \times 1 \times \{(20) - (-10)\} + 15 \times 9.8 \times (80) - 15 \times 1 \times \{(100) - (-10)\} = 13620\text{N}\cdot\text{mm}$$

$$\text{yawing } Ma_2 = -m \cdot a_1 \cdot (Y_m - Y_d)$$

$$Ma_2 = -30 \times 1 \times \{(-20) - (10)\} - 15 \times 1 \times \{(50) - (10)\} = 300\text{N}\cdot\text{mm}$$

$$\text{rolling } Ma_3 = m \cdot g \cdot Y_m$$

$$Ma_3 = 30 \times 9.8 \times (-20) + 15 \times 9.8 \times (50) = 1470\text{N}\cdot\text{mm}$$

<constant>

$$\text{pitching } M_1 = m \cdot g \cdot X_m$$

$$M_1 = 30 \times 9.8 \times (15) + 15 \times 9.8 \times (80) = 16170\text{N}\cdot\text{mm}$$

$$\text{yawing } M_2 = 0$$

$$\text{rolling } M_3 = m \cdot g \cdot Y_m$$

$$M_3 = 30 \times 9.8 \times (-20) + 15 \times 9.8 \times (50) = 1470\text{N}\cdot\text{mm}$$

<deceleration>

$$\text{pitching } Md_1 = m \cdot g \cdot X_m + m \cdot a_3 \cdot (Z_m - Z_d)$$

$$Md_1 = 30 \times 9.8 \times (15) + 30 \times 1 \times \{(20) - (-10)\} + 15 \times 9.8 \times (80) + 15 \times 1 \times \{(100) - (-10)\} = 18720\text{N}\cdot\text{mm}$$

$$\text{yawing } Md_2 = m \cdot a_3 \cdot (Y_m - Y_d)$$

$$Md_2 = 30 \times 1 \times \{(-20) - (10)\} + 15 \times 1 \times \{(50) - (10)\} = -300\text{N}\cdot\text{mm}$$

$$\text{rolling } Md_3 = m \cdot g \cdot Y_m$$

$$Md_3 = 30 \times 9.8 \times (-20) + 15 \times 9.8 \times (50) = 1470\text{N}\cdot\text{mm}$$

② Calculating Load Applied to the Guide Block

<acceleration>

$$\text{Block 1} \quad \text{vertical direction } F_{ra1} = \frac{m \cdot g}{4} - \frac{Ma_1}{2 \cdot L_{\text{unit}}} + \frac{Ma_3}{2 \cdot L_{\text{rail}}}$$

$$F_{ra1} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{13620}{2 \times 100} + \frac{1470}{2 \times 100} = 49.5\text{N}$$

$$\text{horizontal direction } F_{sa1} = \frac{Ma_2}{2 \cdot L_{\text{unit}}}$$

$$F_{sa1} = \frac{300}{2 \times 100} = 1.5\text{N}$$

$$\text{Block 2} \quad \text{vertical direction } F_{ra2} = \frac{m \cdot g}{4} + \frac{Ma_1}{2 \cdot L_{\text{unit}}} + \frac{Ma_3}{2 \cdot L_{\text{rail}}}$$

$$F_{ra2} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{13620}{2 \times 100} + \frac{1470}{2 \times 100} = 185.7\text{N}$$

$$\text{horizontal direction } F_{sa2} = -\frac{Ma_2}{2 \cdot L_{\text{unit}}}$$

$$F_{sa2} = -\frac{300}{2 \times 100} = -1.5\text{N}$$

Block 3

vertical direction $F_{ra3} = \frac{m \cdot g}{4} - \frac{Ma_1}{2 \cdot L_{unit}} - \frac{Ma_3}{2 \cdot L_{rail}}$

 $F_{ra3} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{13620}{2 \times 100} - \frac{1470}{2 \times 100} = 34.8N$

horizontal direction $F_{sa3} = \frac{Ma_2}{2 \cdot L_{unit}}$

 $F_{sa3} = \frac{300}{2 \times 100} = 1.5N$

Block 4

vertical direction $F_{ra4} = \frac{m \cdot g}{4} + \frac{Ma_1}{2 \cdot L_{unit}} - \frac{Ma_3}{2 \cdot L_{rail}}$

 $F_{ra4} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{13620}{2 \times 100} - \frac{1470}{2 \times 100} = 171.0N$

horizontal direction $F_{sa4} = -\frac{Ma_2}{2 \cdot L_{unit}}$

 $F_{sa4} = -\frac{300}{2 \times 100} = -1.5N$

(constant)

Block 1 vertical direction $F_{r1} = \frac{m \cdot g}{4} - \frac{M_1}{2 \cdot L_{unit}} + \frac{M_3}{2 \cdot L_{rail}}$

 $F_{r1} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{16170}{2 \times 100} + \frac{1470}{2 \times 100} = 36.8N$

horizontal direction $F_{s1} = \frac{M_2}{2 \cdot L_{unit}}$

Block 2

vertical direction $F_{r2} = \frac{m \cdot g}{4} + \frac{M_1}{2 \cdot L_{unit}} + \frac{M_3}{2 \cdot L_{rail}}$

 $F_{r2} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{16170}{2 \times 100} + \frac{1470}{2 \times 100} = 198.5N$

horizontal direction $F_{s2} = -\frac{M_2}{2 \cdot L_{unit}}$

Block 3

vertical direction $F_{r3} = \frac{m \cdot g}{4} - \frac{M_1}{2 \cdot L_{unit}} - \frac{M_3}{2 \cdot L_{rail}}$

 $F_{r3} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{16170}{2 \times 100} - \frac{1470}{2 \times 100} = 22.1N$

horizontal direction $F_{s3} = \frac{M_2}{2 \cdot L_{unit}}$

Block 4

vertical direction $F_{r4} = \frac{m \cdot g}{4} + \frac{M_1}{2 \cdot L_{unit}} - \frac{M_3}{2 \cdot L_{rail}}$

 $F_{r4} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{16170}{2 \times 100} - \frac{1470}{2 \times 100} = 183.8N$

horizontal direction $F_{s4} = -\frac{M_2}{2 \cdot L_{unit}}$

(deceleration)

Block 1 vertical direction $F_{rd1} = \frac{m \cdot g}{4} - \frac{Md_1}{2 \cdot L_{unit}} + \frac{Md_3}{2 \cdot L_{rail}}$

 $F_{rd1} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{18720}{2 \times 100} + \frac{1470}{2 \times 100} = 24.0N$

horizontal direction $F_{sd1} = \frac{Md_2}{2 \cdot L_{unit}}$

 $F_{sd1} = -\frac{300}{2 \times 100} = -1.5N$

Block 2 vertical direction $F_{rd2} = \frac{m \cdot g}{4} + \frac{Md_1}{2 \cdot L_{unit}} + \frac{Md_3}{2 \cdot L_{rail}}$

 $F_{rd2} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{18720}{2 \times 100} + \frac{1470}{2 \times 100} = 211.2N$

horizontal direction $F_{sd2} = -\frac{Md_2}{2 \cdot L_{unit}}$

 $F_{sd2} = -\frac{300}{2 \times 100} = 1.5N$

Block 3 vertical direction $F_{rd3} = \frac{m \cdot g}{4} - \frac{Md_1}{2 \cdot L_{unit}} - \frac{Md_3}{2 \cdot L_{rail}}$

 $F_{rd3} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{18720}{2 \times 100} - \frac{1470}{2 \times 100} = 9.3N$

horizontal direction $F_{sd3} = \frac{Md_2}{2 \cdot L_{unit}}$

 $F_{sd3} = \frac{300}{2 \times 100} = -1.5N$

Block 4 vertical direction $F_{rd4} = \frac{m \cdot g}{4} + \frac{Md_1}{2 \cdot L_{unit}} - \frac{Md_3}{2 \cdot L_{rail}}$

 $F_{rd4} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{18720}{2 \times 100} - \frac{1470}{2 \times 100} = 196.5N$

horizontal direction $F_{sd4} = -\frac{Md_2}{2 \cdot L_{unit}}$

 $F_{sd4} = -\frac{300}{2 \times 100} = 1.5N$

③ Calculating Equivalent Load

○Pr in the vertical direction and Ps in the horizontal direction are calculated by the following equations.

$$Pr = |F_r|$$

$$Ps = |k \cdot F_s|$$

k=1 for SGL guide

Table 1-26

	acceleration	constant	deceleration
block 1	P _{ra1} =49.5	P _{r1} =36.8	P _{rd1} =24.0
	P _{sa1} =1.5	P _{s1} =0	P _{sd1} =1.5
block 2	P _{ra2} =185.7	P _{r2} =198.5	P _{rd2} =211.2
	P _{sa2} =1.5	P _{s2} =0	P _{sd2} =1.5
block 3	P _{ra3} =34.8	P _{r3} =22.1	P _{rd3} =9.3
	P _{sa3} =1.5	P _{s3} =0	P _{sd3} =1.5
block 4	P _{ra4} =171.0	P _{r4} =183.8	P _{rd4} =196.5
	P _{sa4} =1.5	P _{s4} =0	P _{sd4} =1.5

◎Equation for Dynamic Equivalent Load

$$P = P_{r1} + P_{s1}$$

$$P_{a1} = P_{ra1} + P_{sa1} = 49.5 + 1.5 = 51.0 \text{ (N)}$$

calculating in the same manner

Table 1-27

	acceleration	constant	deceleration
block 1	P _{a1} =51.0	P ₁ =36.8	P _{d1} =25.5
block 2	P _{a2} =187.2	P ₂ =198.5	P _{d2} =212.7
block 3	P _{a3} =36.3	P ₃ =22.1	P _{d3} =10.8
block 4	P _{a4} =172.5	P ₄ =183.8	P _{d4} =198.0

◎Calculating Average Equivalent Load

$$P_m = \sqrt[3]{\frac{1}{\ell_s} \times \left((P_{a1}^3 \times \frac{V_{max} \times t1}{2}) + (P_1^3 \times V_{max} \times t2) + (P_{d1}^3 \times \frac{V_{max} \times t3}{2}) \right)}$$

$$P_{m1} = \sqrt[3]{\frac{1}{700} \times \left((51.0^3 \times \frac{200 \times 0.2}{2}) + (36.8^3 \times 200 \times 3.3) + (25.5^3 \times \frac{200 \times 0.2}{2}) \right)} = 37.1 \text{ (N)}$$

$$P_{m2} = \sqrt[3]{\frac{1}{700} \times \left((187.2^3 \times \frac{200 \times 0.2}{2}) + (198.5^3 \times 200 \times 3.3) + (212.7^3 \times \frac{200 \times 0.2}{2}) \right)} = 198.6 \text{ (N)}$$

$$P_{m3} = \sqrt[3]{\frac{1}{700} \times \left((36.3^3 \times \frac{200 \times 0.2}{2}) + (22.1^3 \times 200 \times 3.3) + (10.8^3 \times \frac{200 \times 0.2}{2}) \right)} = 22.6 \text{ (N)}$$

$$P_{m4} = \sqrt[3]{\frac{1}{700} \times \left((172.5^3 \times \frac{200 \times 0.2}{2}) + (183.8^3 \times 200 \times 3.3) + (198.0^3 \times \frac{200 \times 0.2}{2}) \right)} = 183.9 \text{ (N)}$$

④Calculating Rated Life

Decide each coefficient

f_H : hardness coefficient f_H=1 for hardness of guide is 58HRC or more

f_T : temperature coefficient f_T=1 operating temperature is below 100°C (80°C is maximum for SGL guide)

f_C : contact coefficient f_C=1 for blocks are not in close contact

f_w: applied load coefficient f_w=1.5 for V_{max}=200mm/s

◎Calculating Rated Life

Selecting Block 2 that carries the maximum dynamic equivalent load

$$L = \left(\frac{f_H \times f_T \times f_C}{f_w} \times \frac{C}{P_m} \right)^3 \times 50$$

$$L = \left(\frac{1 \times 1 \times 1}{1.5} \times \frac{7290}{198.6} \right)^3 \times 50 = 732725 \text{ (km)}$$

◎Calculating Life Time

$$L_h = \frac{L \times 10^3}{2 \times \ell_s \times n_1 \times 60}$$

$$L_h = \frac{732725 \times 10^3}{2 \times 0.7 \times 8 \times 60} = 1090364 \text{ (hour)}$$

⑤Calculating Static Safety Factor

◎Equation for Static Equivalent Load

$$P_o = P_{r1} + P_{s1}$$

$$P_{o1} = P_{ra1} + P_{sa1} = 49.5 + 1.5 = 51.0 \text{ (N)}$$

calculating in the same manner

Table 1-28

	acceleration	constant	deceleration
block 1	P _{o1} =51.0	P _{o1} =36.8	P _{od1} =25.5
block 2	P _{o2} =187.2	P _{o2} =198.5	P _{od2} =212.7
block 3	P _{o3} =36.3	P _{o3} =22.1	P _{od3} =10.8
block 4	P _{o4} =172.5	P _{o4} =183.8	P _{od4} =198.0

Selecting Block 2 that carries the maximum static equivalent load

$$f_s = \frac{C_o}{P_o}$$

$$f_s = \frac{C_o}{P_{od2}} = \frac{9450}{212.7} = 44$$

RATED LIFE CALCULATION EXAMPLE 2

① Calculating Moment Applied to the Unit

<acceleration>

pitching $M_{a1}=m \cdot g \cdot X_m - m \cdot a_1 \cdot (Z_m - Z_d)$

$$M_{a1}=5 \times 9.8 \times (0) - 5 \times 1.5 \times \{(10) - (-10)\} + 20 \times 9.8 \times (-20) - 20 \times 1.5 \times \{(20) - (-10)\} = -4970\text{N}\cdot\text{mm}$$

yawing $M_{a2}=-m \cdot a_1 \cdot (Y_m - Y_d)$

$$M_{a2}=-5 \times 1.5 \times \{(0) - (-30)\} - 20 \times 1.5 \times \{(-10) - (-30)\} = -825\text{N}\cdot\text{mm}$$

rolling $M_{a3}=m \cdot g \cdot Y_m$

$$M_{a3}=5 \times 9.8 \times (0) + 20 \times 9.8 \times (-10) = -1960\text{N}\cdot\text{mm}$$

<constant>

pitching $M_1=m \cdot g \cdot X_m$

$$M_1=5 \times 9.8 \times (0) + 20 \times 9.8 \times (-20) = -3920\text{N}\cdot\text{mm}$$

yawing $M_2=0$

$$M_2=0\text{ N}\cdot\text{mm}$$

rolling $M_3=m \cdot g \cdot Y_m$

$$M_3=5 \times 9.8 \times (0) + 20 \times 9.8 \times (-10) = -1960\text{N}\cdot\text{mm}$$

<deceleration>

pitching $M_{d1}=m \cdot g \cdot X_m + m \cdot a_3 \cdot (Z_m - Z_d)$

$$M_{d1}=5 \times 9.8 \times (0) + 5 \times 1.5 \times \{(10) - (-10)\} + 20 \times 9.8 \times (-20) + 20 \times 1.5 \times \{(20) - (-10)\} = -2870\text{N}\cdot\text{mm}$$

yawing $M_{d2}=m \cdot a_3 \cdot (Y_m - Y_d)$

$$M_{d2}=5 \times 1.5 \times \{(0) - (-30)\} + 20 \times 1.5 \times \{(-10) - (-30)\} = 825\text{N}\cdot\text{mm}$$

rolling $M_{d3}=m \cdot g \cdot Y_m$

$$M_{d3}=5 \times 9.8 \times (0) + 20 \times 9.8 \times (-10) = -1960\text{N}\cdot\text{mm}$$

② Calculating Load Applied to the Guide Block

⟨acceleration⟩

Block 1

vertical direction $F_{ra1} = \frac{m \cdot g}{2} - \frac{Ma_1}{L_{unit}}$

$$F_{ra1} = \frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} - \frac{-4970}{70} = 193.5N$$

horizontal direction $F_{sa1} = \frac{Ma_2}{L_{unit}}$

$$F_{sa1} = \frac{-825}{70} = -11.8N$$

rolling moment $M_{ra1} = \frac{Ma_3}{2}$

$$M_{ra1} = \frac{-1960}{2} = -980N \cdot mm$$

Block 2

vertical direction $F_{ra2} = \frac{m \cdot g}{2} + \frac{Ma_1}{L_{unit}}$

$$F_{ra2} = \frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} + \frac{-4970}{70} = 51.5N$$

horizontal direction $F_{sa2} = \frac{Ma_2}{L_{unit}}$

$$F_{sa2} = \frac{-825}{70} = -11.8N$$

rolling moment $M_{ra2} = \frac{Ma_3}{2}$

$$M_{ra2} = \frac{-1960}{2} = -980N \cdot mm$$

⟨constant⟩

Block 1

vertical direction $F_{r1} = \frac{m \cdot g}{2} - \frac{M_1}{L_{unit}}$

$$F_{r1} = \frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} - \frac{-3920}{70} = 178.5N$$

horizontal direction $F_{s1} = \frac{M_2}{L_{unit}}$

rolling moment $M_{r1} = \frac{M_3}{2}$

$$M_{r1} = \frac{-1960}{2} = -980N \cdot mm$$

Block 2

vertical direction $F_{r2} = \frac{m \cdot g}{2} + \frac{M_1}{L_{unit}}$

$$F_{r2} = \frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} + \frac{-3920}{70} = 66.5N$$

horizontal direction $F_{s2} = -\frac{M_2}{L_{unit}}$

rolling moment $M_{r2} = \frac{M_3}{2}$

$$M_{r2} = \frac{-1960}{2} = -980N \cdot mm$$

⟨deceleration⟩

Block 1

vertical direction $F_{rd1} = \frac{m \cdot g}{2} - \frac{Md_1}{L_{unit}}$

$$F_{rd1} = \frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} - \frac{-2870}{70} = 163.5N$$

horizontal direction $F_{sd1} = \frac{Md_2}{L_{unit}}$

$$F_{sd1} = \frac{825}{70} = 11.8N$$

rolling moment $M_{rd1} = \frac{Md_3}{2}$

$$M_{rd1} = \frac{-1960}{2} = -980N \cdot mm$$

Block 2

vertical direction $F_{rd2} = \frac{m \cdot g}{2} + \frac{Md_1}{L_{unit}}$

$$F_{rd2} = \frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} + \frac{-2870}{70} = 81.5N$$

horizontal direction $F_{sd2} = -\frac{Md_2}{L_{unit}}$

$$F_{sd2} = -\frac{825}{70} = -11.8N$$

rolling moment $M_{rd2} = \frac{Md_3}{2}$

$$M_{rd2} = \frac{-1960}{2} = -980N \cdot mm$$

③ Calculating Equivalent Load

◎ Pr in the vertical direction and Ps in the horizontal direction are calculated by the following equations.

$$Pr = |Fr| + |Er \cdot Mr|$$

$$Ps = |k \cdot Fs|$$

Er=0.220 for SEB9A

k=0.84 for SEB-A guide

$$Pra_1 = |Fr_{a1}| + |Er \cdot Mr_{a1}| = |193.5| + |0.220 \times (-980)| = 409.1 \text{ (N)}$$

calculating in the same manner

Table 1-29

	acceleration	constant	deceleration
block 1	Pra ₁ =409.1	Pr ₁ =394.1	Prd ₁ =379.1
	Psa ₁ =9.9	Ps ₁ =0	Psd ₁ =9.9
block 2	Pra ₂ =267.1	Pr ₂ =282.1	Prd ₂ =297.1
	Psa ₂ =9.9	Ps ₂ =0	Psd ₂ =9.9

◎ Equation for Dynamic Equivalent Load

$$P=Pr+Ps$$

$$Pa_1=Pr_{a1}+Ps_{a1}=409.1+9.9=419.0 \text{ (N)}$$

calculating in the same manner

Table 1-30

	acceleration	constant	deceleration
block 1	Pa ₁ =419.0	P ₁ =394.1	Pd ₁ =389.0
block 2	Pa ₂ =277.0	P ₂ =282.1	Pd ₂ =307.0

◎ Calculating Average Equivalent Load

$$Pm=\sqrt[3]{\frac{1}{ls} \times \left(Pa^3 \times \frac{V_{max} \times t_1}{2} + P^3 \times V_{max} \times t_2 + (Pd^3 \times \frac{V_{max} \times t_3}{2}) \right)}$$

$$Pm_1=\sqrt[3]{\frac{1}{300} \times \left(419.0^3 \times \frac{150 \times 0.1}{2} + (394.1^3 \times 150 \times 1.9) + (389.0^3 \times \frac{150 \times 0.1}{2}) \right)}=394.6 \text{ (N)}$$

$$Pm_2=\sqrt[3]{\frac{1}{300} \times \left(277.0^3 \times \frac{150 \times 0.1}{2} + (282.1^3 \times 150 \times 1.9) + (307.0^3 \times \frac{150 \times 0.1}{2}) \right)}=282.7 \text{ (N)}$$

④ Calculating Rated Life

Decide each coefficient

f_H: hardness coefficient f_H=1 for hardness of guide is 58HRC or more

f_T: temperature coefficient f_T=1 operating temperature is below 100°C

(80°C is maximum for SEB-A guide)

f_C: contact coefficient f_C=1 for blocks are not in close contact

f_w: applied load coefficient f_w=1.5 for V_{max}=150mm/s

◎ Calculating Rated Life

Selecting Block 1 that carries the maximum dynamic equivalent load

$$L=\left(\frac{f_H \times f_T \times f_C}{f_w} \times \frac{C}{P_m}\right)^3 \times 50$$

$$L=\left(\frac{1 \times 1 \times 1}{1.5} \times \frac{1920}{394.6}\right)^3 \times 50=1706 \text{ (km)}$$

◎ Calculating Life Time

$$L_h=\frac{L \times 10^3}{2 \times l_s \times n_1 \times 60}$$

$$L_h=\frac{1706 \times 10^3}{2 \times 0.3 \times 14 \times 60}=3384 \text{ (hour)}$$

⑤ Calculating Static Safety Factor

◎ Equation for Static Equivalent Load

$$Po=Pr+Ps$$

$$Po_{a1}=Pr_{a1}+Ps_{a1}=409.1+9.9=419.0 \text{ (N)}$$

calculating in the same manner

Table 1-31

	acceleration	constant	deceleration
block 1	Po ₁ =419.0	P ₁ =394.1	Pd ₁ =389.0
block 2	Po ₂ =277.0	P ₂ =282.1	Pd ₂ =307.0

Selecting Block 1 that carries the maximum static equivalent load

$$f_s=\frac{C_o}{P_o}$$

$$f_s=\frac{C_o}{Po_{a1}}=\frac{2530}{419.0}=6.0$$

RATED LIFE CALCULATION EXAMPLE 3

$M_{d1}=5 \times 9.8 \times \{(30) - (-20)\} - 5 \times 1.5 \times \{(30) - (-20)\} + 20 \times 9.8 \times \{(20) - (-20)\} - 20 \times 1.5 \times \{(20) - (-20)\} = 8715\text{N}\cdot\text{mm}$

yawing $M_{d2}=m \cdot g \cdot (Y_m - Y_d) - m \cdot a_3 \cdot (Y_m - Y_d)$

$M_{d2}=5 \times 9.8 \times \{(0) - (20)\} - 5 \times 1.5 \times \{(0) - (20)\} + 20 \times 9.8 \times \{(50) - (20)\} - 20 \times 1.5 \times \{(50) - (20)\} = 4150\text{N}\cdot\text{mm}$

rolling $M_{d3}=0$

② Calculating Load Applied to the Slide Bush

<acceleration>

Bush 1 vertical direction $F_{ra1}=\frac{M_{a3}}{L_{\text{rail}}}=0$

horizontal direction $F_{sa1}=0$

pitching $M_{pa1}=\frac{M_{a1}}{2}$

$M_{pa1}=\frac{11865}{2}=5932.5\text{N}\cdot\text{mm}$

yawing $M_{ya1}=\frac{M_{a2}}{2}$

$M_{ya1}=\frac{5650}{2}=2825\text{N}\cdot\text{mm}$

Bush 2

vertical direction $F_{ra2} = \frac{Ma_3}{L_{rail}} = 0$

horizontal direction $F_{sa2} = 0$

pitching $M_{pa2} = \frac{Ma_1}{2}$

$$M_{pa2} = \frac{11865}{2} = 5932.5 \text{ N} \cdot \text{mm}$$

yawing $M_{ya2} = \frac{Ma_2}{2}$

$$M_{ya2} = \frac{5650}{2} = 2825 \text{ N} \cdot \text{mm}$$

{constant}

Bush 1

vertical direction $F_{r1} = \frac{M_3}{L_{rail}} = 0$

horizontal direction $F_{s1} = 0$

pitching $M_{p1} = \frac{M_1}{2}$

$$M_{p1} = \frac{10290}{2} = 5145 \text{ N} \cdot \text{mm}$$

yawing $M_{y1} = \frac{M_2}{2}$

$$M_{y1} = \frac{4900}{2} = 2450 \text{ N} \cdot \text{mm}$$

Bush 2

vertical direction $F_{r2} = \frac{M_3}{L_{rail}} = 0$

horizontal direction $F_{s2} = 0$

pitching $M_{p2} = \frac{M_1}{2}$

$$M_{p2} = \frac{10290}{2} = 5145 \text{ N} \cdot \text{mm}$$

yawing $M_{y2} = \frac{M_2}{2}$

$$M_{y2} = \frac{4900}{2} = 2450 \text{ N} \cdot \text{mm}$$

{deceleration}

Bush 1

vertical direction $F_{rd1} = \frac{Md_3}{L_{rail}} = 0$

horizontal direction $F_{sd1} = 0$

pitching $M_{pd1} = \frac{Md_1}{2}$

$$M_{pd1} = \frac{8715}{2} = 4357.5 \text{ N} \cdot \text{mm}$$

yawing $M_{yd1} = \frac{Md_2}{2}$

$$M_{yd1} = \frac{4150}{2} = 2075 \text{ N} \cdot \text{mm}$$

Bush 2

vertical direction $F_{rd2} = \frac{Md_3}{L_{rail}} = 0$

horizontal direction $F_{sd2} = 0$

pitching $M_{pd2} = \frac{Md_1}{2}$

$$M_{pd2} = \frac{8715}{2} = 4357.5 \text{ N} \cdot \text{mm}$$

yawing $M_{yd2} = \frac{Md_2}{2}$

$$M_{yd2} = \frac{4150}{2} = 2075 \text{ N} \cdot \text{mm}$$

③ Calculating Equivalent Load

◎ Pr in the vertical direction and Ps in the horizontal direction are calculated by the following equations.

$$Pr = |Fr| + |E_1 \cdot Mp|$$

$$Ps = |k \cdot Fs| + |E_1 \cdot My|$$

$$E_1 = 6.63 \times 10^{-2} \text{ for SM30W}$$

k=1 for Slide Bush

Table 1-32

	acceleration	constant	deceleration
bush 1	Pra ₁ =393.3	Pr ₁ =341.1	Prd ₁ =288.9
	Psa ₁ =187.3	Ps ₁ =162.4	Psd ₁ =137.6
bush 2	Pra ₂ =393.3	Pr ₂ =341.1	Prd ₂ =288.9
	Psa ₂ =187.3	Ps ₂ =162.4	Psd ₂ =137.6

◎ Equation for Dynamic Equivalent Load

$$P = Pr + Ps$$

$$Par = Pra₁ + Psa₁ = 393.3 + 187.3 = 580.6(N)$$

calculating in the same manner

Table 1-33

	acceleration	constant	deceleration
bush 1	Pa ₁ =580.6	P ₁ =503.5	Pd ₁ =426.5
bush 2	Pa ₂ =580.6	P ₂ =503.5	Pd ₂ =426.5

◎ Calculating Average Equivalent Load

$$Pm = \sqrt{\frac{1}{\ell_s} \times \left((Pa^3 \times \frac{V_{max} \times t_1}{2}) + (P^3 \times V_{max} \times t_2) + (Pd^3 \times \frac{V_{max} \times t_3}{2}) \right)}$$

$$Pm_1 = \sqrt{\frac{1}{120} \times \left((580.6^3 \times \frac{150 \times 0.1}{2}) + (503.5^3 \times 150 \times 0.7) + (426.5^3 \times \frac{150 \times 0.1}{2}) \right)} = 505.0(N)$$

$$Pm_2 = \sqrt{\frac{1}{120} \times \left((580.6^3 \times \frac{150 \times 0.1}{2}) + (503.5^3 \times 150 \times 0.7) + (426.5^3 \times \frac{150 \times 0.1}{2}) \right)} = 505.0(N)$$

④ Calculating Rated Life

Decide each coefficient

f_H: hardness coefficient f_H=1 for hardness of bush is 58HRC or more

f_T: temperature coefficient f_T=1 operating temperature is below 100°C
(80°C is maximum for Bush with resin retainer)

f_C: contact coefficient f_C=1 for bushes are not in close contact

f_w: applied load coefficient f_w=1.5 for V_{max}=150mm/s

◎ Calculating Rated Life

Selecting Bush 1 that carries the maximum equivalent load

$$L = \left(\frac{f_H \times f_T \times f_C}{f_w} \times \frac{C}{P_m} \right)^3 \times 50$$

$$L = \left(\frac{1 \times 1 \times 1}{1.5} \times \frac{2490}{505.0} \right)^3 \times 50 = 1775(\text{km})$$

◎ Calculating Life Time

$$L_h = \frac{L \times 10^3}{2 \times \ell_s \times n_1 \times 60}$$

$$L_h = \frac{1775 \times 10^3}{2 \times 0.120 \times 33 \times 60} = 3735(\text{hour})$$

⑤ Calculating Static Safety Factor

◎ Equation for Static Equivalent Load

$$Po = Pr + Ps$$

$$Po_1 = Pra_1 + Psa_1 = 393.3 + 187.3 = 580.6(N)$$

calculating in the same manner

Table 1-34

	acceleration	constant	deceleration
bush 1	Po ₁ =580.6	Po ₁ =503.5	Po ₁ =426.5
bush 2	Po ₂ =580.6	Po ₂ =503.5	Po ₂ =426.5

Selecting Bush 1 that carries the maximum static equivalent load

$$fs = \frac{Co}{Po}$$

$$fs = \frac{Co}{Po_1} = \frac{5490}{580.6} = 9.4$$

RIGIDITY AND PRELOAD

Effect of Preload and Rigidity

The rigidity of a linear systems must be taken into consideration when it is to be used in high-precision positioning devices or high-precision machinery. Preloaded slide guides and ball splines, which use balls as the rolling elements, are available upon request to meet the need for greater rigidity.

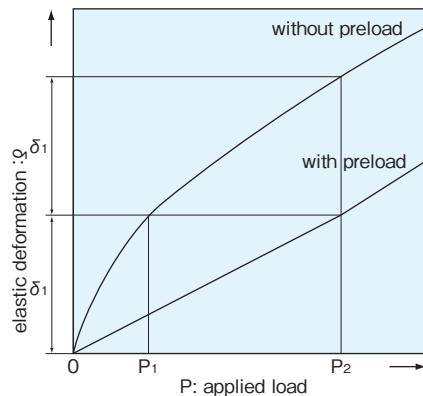

If a force is applied to the ball elements without preload, an elastic deformation proportional to the applied force to the 2/3 power will result. Therefore, the elastic deformation is relatively large during the initial loading stage, however then becomes smaller as the load increases.

Preloading on the rolling elements absorbs the deformation of the block under the same loading. Please contact NB for available data in regard to rigidity.

Types of Preload and its Specification

Preload is categorized into three ranges: standard, light, and medium for option. In the NB linear systems, preload is applied by installing rolling elements that are slightly larger than standard. Therefore, the specification of the preload is expressed by a negative value.

Figure 1-16 Applied Load versus Block Deformation

FRICTIONAL RESISTANCE AND REQUIRED THRUST

The static friction of a linear systems is extremely low. Since the difference between the static and dynamic friction is marginal, stable motion can be achieved from low to high speed. The frictional resistance (required thrust) can be obtained from the load and the seal resistance unique to each type of system using the following equation:

$$F = \mu \cdot W + f \quad \dots \dots \dots \quad (14)$$

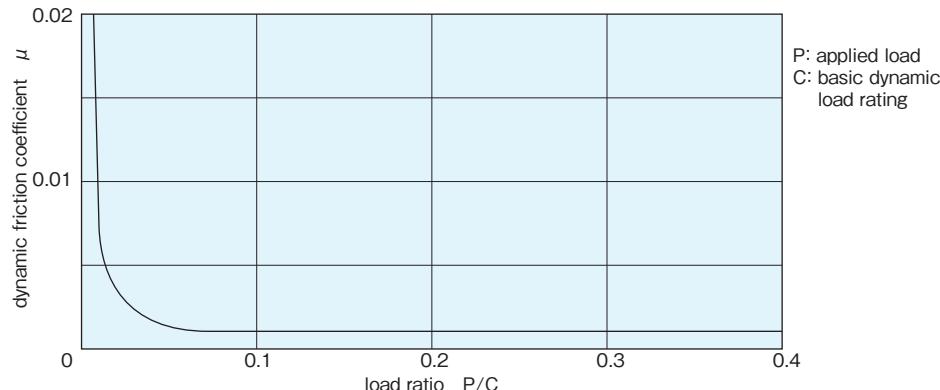

F: frictional resistance (N) μ : dynamic friction coefficient
W: applied load (N) f: seal resistance (N)

The dynamic friction coefficient varies with the applied load, preload, viscosity of the lubricant, and other factors. However, the values given in Table 1-35 are used for the normal loading condition (20% of basic dynamic load rating) without any preload. The seal resistance depends on the seal-lip condition as well as on the condition of the lubricant, however, it does not change proportionally with the applied load, which commonly is expressed by a constant value of 2 to 5 N.

Table 1-35 Dynamic Friction Coefficient

OPERATING ENVIRONMENT

Temperature Range

The NB linear systems are heat-treated in order to harden the surface. Therefore, if the temperature of the linear systems exceeds 100°C, the hardness and load rating will be reduced (refer to page Eng-5, hardness coefficient). If resin is used in any one of the components, the systems cannot be used in a high-temperature environment. The recommended operating temperature ranges for each type of linear systems are listed in Table 1-36.

Table 1-36 Major Types and Recommended Temperature Range

* If the system is made of stainless steel and has a seal, the temperature range is up to 120°C

** Please contact NB if the system is to be used out of room temperatures.

Operating Environment

Foreign particles or dust in the linear systems affects the motion accuracy and shortens the life time. Standard seals will perform well for dust prevention under normal operating conditions, however, in a harsh environment it is necessary to attach bellows or protective covers as Figure 1-18 shows.

Figure 1-18 Example of Dust Prevention

LUBRICATION

Lubrication

The objective of lubrication includes the reduction of friction among the rolling elements as well as between the rolling elements and the raceway, preventing of sintering, reduction of wear, and prevention of rust by forming a film over the surface.

To maximize the performance of a linear systems, the lubricant type and a lubrication method appropriate for the operating environment should be selected.

In addition, the steel part of the product is applied with rust-preventing oil that has little effect on the lubrication.

Table 1-37 (1) Lubrication

lubrication	type
grease lubrication	lithium soap based grease
	urea grease
oil lubrication	Turbine Oil ISO Standard VG32 ~ 68

Both oil and grease lubrication are applicable. Please select proper lubricant and its method in conformity to operating conditions.

Table 1-37 (2) Pre-applied Lubricant

Miniature Slide	lithium soap based grease pre-applied
Gonio Way	lithium soap based grease pre-applied
Actuator	lithium soap based grease pre-applied
Slide Screw	radial ball bearings part lithium based grease pre-applied

For products applied with 'anti-rust oil only', remove the anti-rust oil from the factory and enclose the lubricant before use.

The product with "Lithium Soap Grease pre-applied" is filled with grease and can be used as is. When installing the product, it is recommended to remove the rust preventive oil from the mounting surface before assembling.

Lubrication Interval

Please relubricate with a similar type of grease periodically depending on the operating condition. The recommended relubrication period is about 6 months or 1,000 km of travel distance under normal condition. It is possible to extend the lubrication interval. Fiber sheet (P.A-16) is available for slide guide, and felt seal (P.C-11) is available for slide bush.

By installing a reverse seal (P.A-17) for slide guide and a double lip seal (P.C-11) for slide bush, it is possible to prevent grease leakage and extend the lubrication interval.

NB provides the following optional greases. Please select one in accordance with the use conditions of your linear system.

●KGLA Grease (Low Dust Generation Grease)

KGLA Grease has an excellent property of low dust generation with a lithium-type thickening agent used. It is ideal for use in a clean room.

●KGU Grease (Low Dust Generation Grease)

With urea-type thickening agent used, KGU Grease has features including a superior low dust generation property and the reduced dynamic frictional resistance during low-speed operation.

Table 1-38 Main Property

item	grease name	
	KGLA Grease	KGU Grease
appearance	whitish-yellow	light brown
base oil	synthetic oil and refined oil mixed	synthetic oil and refined oil mixed

●Grease for the food processing industry (NSF H1 certified) is available.

It is the most suitable combination for the food processing applications to use this type of grease with stainless steel products. Please contact NB for details.

Figure 1-21 Raceway Condition after Testing

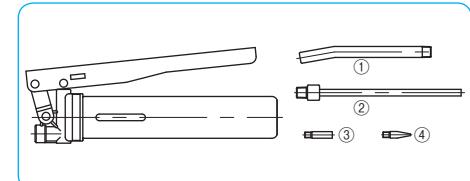

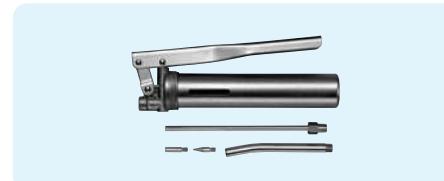

NB MAINTENANCE KIT

There are two types of maintenance kit available at NB.

1. Grease Gun Set: GG1

Different types of nozzles are adaptable to a variety of products including Actuators and products with grease-fitting.

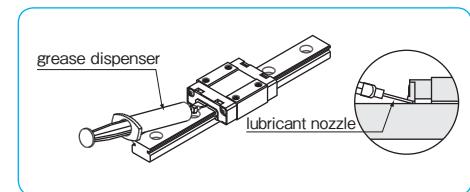

product	EXRAIL Slide Guide	Slide Bush	Slide Rotary Bush	Actuator	Others
① lubricant nozzle (φ10) X all size SGL all size SGW (21,27,35)	TR □ -Q TQ □ (30,35,40) SMA-W SME-W	SMA-RW	BG (46,55)		—
③ and ② lubricant nozzle (φ 5) SGW (17)	TQ □ (16,20,25)	—	BG (20,26,33) BH (23,30)	—	—
④ and ② lubricant nozzle —	—	—	—	—	Applied with ball screw or lubrication hole

In the case of difficulty in pumping, due to internal grease adhesion or shape of the bearing, please use nozzle ④ to apply grease directly onto running grooves.

2. Grease Dispenser: TU1

Syringe dispenser is recommended for miniature guide (SEBS-B type) and for limited space applications.

① Lubricant Nozzle (19G)
Needle Diameter : φ1.00
Needle Inner Diameter : φ0.67 (for KGF Grease)

② Lubricant Nozzle (17G)
Needle Diameter : φ1.50
Needle Inner Diameter : φ1.03 (for KGLA・KGU Grease)

PRECAUTIONS FOR HANDLING AND USE

Please follow the instructions below to maintain the accuracy of NB linear systems as a precision part and for a safety use.

⚠ (1) Notes on Handling

- ① Any shock load caused by rough handling (such as dropping or hitting with hammer) may cause a scar or dent on the raceway which will hinder smooth movement and shorten expected travel life. Also be aware that such impact may damage the resin parts.
- ② Never try to disassemble the product. Doing so may cause an entry of contamination or deterioration of assembly accuracy.
- ③ The blocks or the outer cylinders may move just by tilting the rail or the shaft. Be careful not to let them fall off from the rail or the shaft by mistake.
- ④ The accuracy on the mounting surface and parallelism of the rails or the shafts after assembly are important factors to optimize the performance of the linear systems. Exercise adequate care for mounting accuracy.

⚠ (2) Notes on Use

- ① Be careful not to let dust or foreign particles enter the linear systems during use.
- ② When using the linear systems under an environment where dust or coolant may scatter, protect the system with a cover or bellows.
- ③ When the NB linear systems is used in a manner that its rail is fixed to the ceiling and downward load is applied to the block (s) or the outer cylinder (s), if the block or the outer cylinder breaks, it may fall off from the rail and drop to the floor. Provide additional measures for preventing dropping of the block or the outer cylinder, such as a safety catch.

⚠ (3) Instructions in considering the "Life Time" of a Linear System

- ① When the load applied to a block or an outer cylinder exceeds 0.5 time of the basic dynamic load rating ($P > 0.5C$), the actual life of the systems may become shorter than a calculated life time. Therefore, it is recommended to use the systems with 0.5C or lower.
 - ② In the repetition of very minute stroke, where the rolling element, a steel ball or a cylindrical roller, makes only less than a half turn, early wear called fretting occurs at the contact points between the rolling elements and the raceway. There is no perfect measure to avoid this, but the life of the system can be extended by using anti-fretting grease and moving the blocks or the outer cylinders for the full stroke length once in a few thousand times of use.
- Anti-fretting grease is available as an option. Please select it for applications with very minute stroke length.

ROLLER GUIDE EXRAIL®

The NB roller guide EXRAIL is the latest innovation of the linear motion bearing utilizing the rolling motion of needle rollers which achieve high rigidity, high motion accuracy, and high damping capability. Can be used for variety of applications such as precision machining equipment requiring high load and precision motion capability.

STRUCTURE AND ADVANTAGES

The NB roller guide EXRAIL consists of a rail with 4 rows of precisely machined raceway grooves and a block assembly. The block consisting of the main body, needle rollers, return caps and seals.

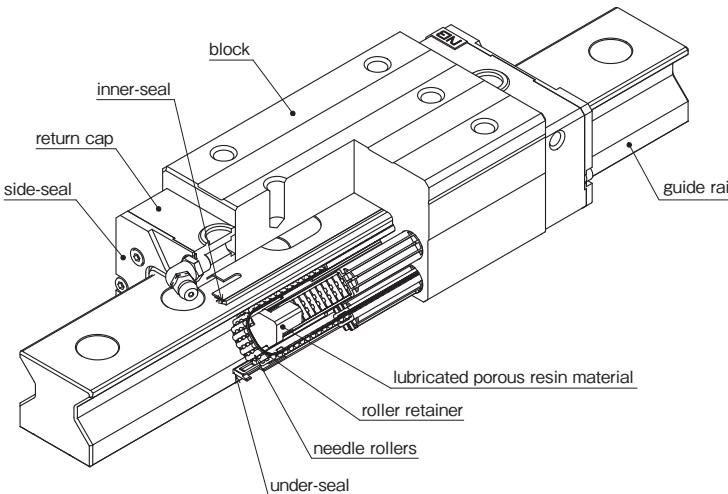

High Rigidity

Miniature needle rollers allows increase in the number of rollers and disperses the load onto each roller, reducing the load prevents elastic deformation and allows the rigidity to become more than 1.5 times higher compared to other competitors.

High Motion Accuracy

Since load is dispersed among multiple miniature needle rollers, it reduces the rolling element passage vibration(※) occurring during movement of linear guides to less than 1/2.

Figure X-1 Structure of EXRAIL

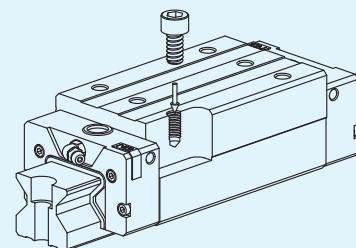

(※)the rolling element passage vibration: the vibration due to the periodic postural change due to the amount and position of the rolling elements supporting the load.

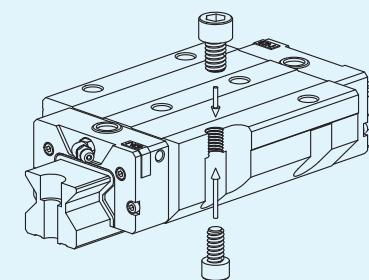

BLOCK TYPES

Two EXRAIL block types are available depending on the mounting methods.

X-HYF

P.X-16

P.X-18

ACCURACY

The EXRAIL guides are available with only high grade (H) accuracy.

Table X-1 Accuracy

part number	X35	X45, 55	unit: mm
accuracy grade		high

allowable dimensional difference in height H	± 0.04	± 0.05	
paired difference for height H	0.015	0.015	
allowable dimensional difference in width W	± 0.04	± 0.05	
paired difference for width W	0.015	0.02	
running parallelism of surface C to surface A			refer to Figure X-2,3
running parallelism of surface D to surface B			

Figure X-2 Motion Accuracy

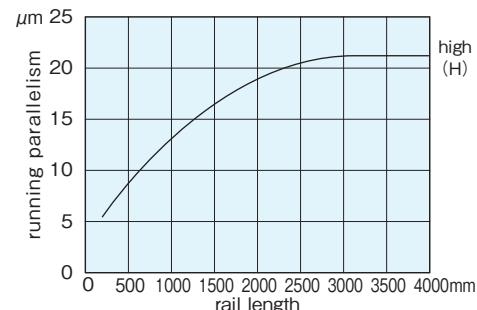

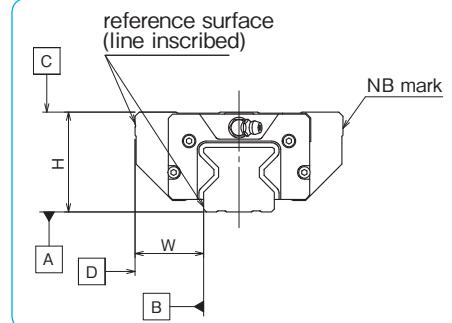

Figure X-3 Accuracy

ACCURACY MEASUREMENT METHOD

The accuracy of the EXRAIL guides is expressed in terms of the value at the center portion.

Dimensional Tolerance and Paired Difference

The accuracy of the EXRAIL guide is obtained by measuring the height H, and width W, as shown in Figure X-3 on P.X-3. The dimensional tolerance is measured for each of the blocks attached to the rail and is expressed in terms of the deviation from the basic dimension. The paired difference is obtained by measuring the blocks attached to the rail and is expressed in terms of the difference between the maximum and minimum values.

Motion Accuracy

The rail is first fixed to the reference base. The motion accuracy is obtained by measuring the difference in the indicator readings (running parallelism) when the block is moved along the entire span of the rail.

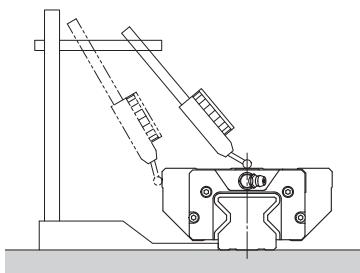

Note: Gauge head is placed on the center of the block reference surface.

Notation for Number of Axes and Paired Difference

When more than one EXRAIL is used in parallel, the dimensional difference must be measured on more than one block on more than one rail. For measuring the paired difference for height H, please specify the number of axes (W2, W3) as the part number example shows. For measuring the paired difference for width W, please contact NB.

Note : When four EXRAILS are used as illustrated in Figure X-5, W4 should be specified in the part number. Please indicate the number of axes when ordering.

LOAD RATING AND RATED LIFE

Loading Direction and Load Rating

An EXRAIL guide experiences load and moment, as shown in Figure X-6. For each load and moment, the basic load ratings and allowable static moments are defined.

Figure X-6 Direction of Load

Rated Life Calculation

Needle rollers are used for the rolling elements in the EXRAIL guides, the life is calculated with the following equations;

$$L = \left(\frac{f_c \cdot f_T \cdot C_{100}}{f_w} \right)^{10/3} \cdot 100$$

L : rated life (km) f_c : contact coefficient
 f_T : temperature coefficient f_w : applied load coefficient
 C_{100} : 100km basic dynamic load rating (N)
P: applied load (N)

※ Refer to page Eng-5 for the coefficients.

※ The contact coefficient is applied when two or more blocks are used in close contact.

If the stroke length and cycles are constant, life can be expressed in terms of time, the equation is;

$$L_h = \frac{L \cdot 10^3}{2 \cdot \ell_s \cdot n_1 \cdot 60}$$

L_h : life time (hr) ℓ_s : stroke length (m)
L : rated life (km) n_1 : number of cycles per minute (cpm)

RAIL LENGTH

Guide rails with most commonly used lengths are available as standard. For the EXRAIL guides with a nonstandard length, unless otherwise specified, the distance from one end of the rail to the first hole center (N) will be within the range listed in Table X-3, satisfying the following equation.

$$L = M \cdot P + 2N$$

L: length (mm)
N: distance from the end of the rail to the first hole center (mm)
M: number of pitches P: hole pitch (mm)

Table X-3 N Dimension unit : mm

part number	and over	N less than
X35	10	30
X45	12.5	38.75
X55	15	45

Figure X-7 Rail

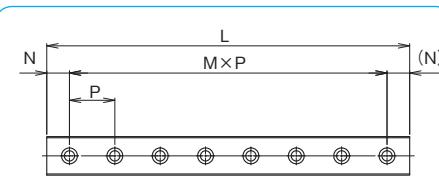

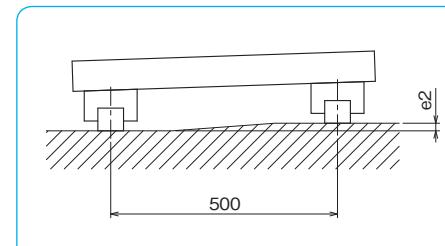

Figure X-9 Error Allowance in Vertical Level between 2 Axes

MOUNTING

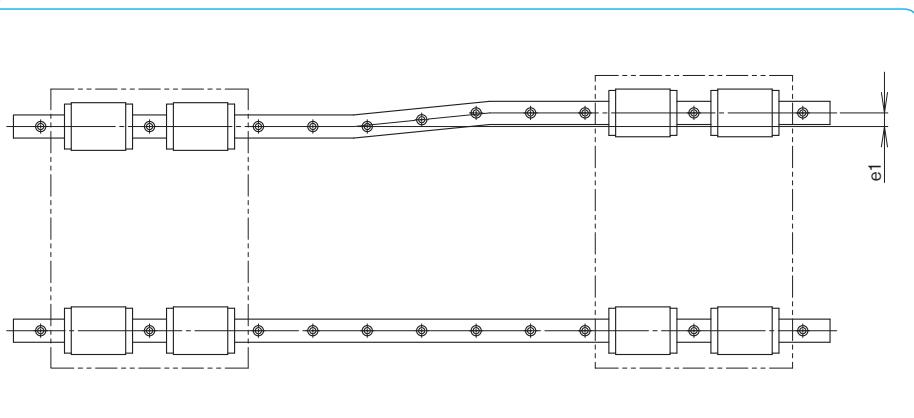

Error Allowance of Mounting Surface

Since the EXRAIL guides have high rigidity, even the slightest error on the mounting surface greatly affects the service life and the dynamic frictional resistance. The values given in Table X-4 are the error allowance of the mounting surface.

Table X-4 Error Allowance of Mounting Surface unit: μm

allowance	X35	X45	X55
e1 error allowance in parallelism between 2 axes	5	7	8
e2 error allowance in vertical level between 2 axes	$80 \mu\text{m} / 500\text{mm rail span}$		

Figure X-8 Error Allowance in Parallelism between 2 Axes

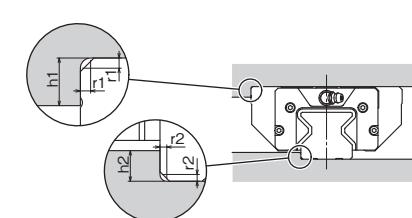

Mounting Surface Profile

The EXRAIL guides are generally mounted by pushing the reference surface of the rail and block against the shoulder of the mounting surface. The shoulder profile as shown in Figure X-10 should be provided in order to avoid interference with the corner of the rail or block. The recommended shoulder dimensions are shown in Table X-5.

Table X-5 Mounting Surface Profile unit : mm

part number	h_1	h_2	$r_{1\max}$	$r_{2\max}$

Figure X-10 Mounting Surface Profile

Fastening Torque for Rail

The screws to fasten the rail should be tightened to an equal torque using a torque wrench in order to secure the motion accuracy. The recommended torque values are given in Table X-6. Please adjust the torque depending on the operating conditions.

Table X-6 Recommended Torque unit : N · m

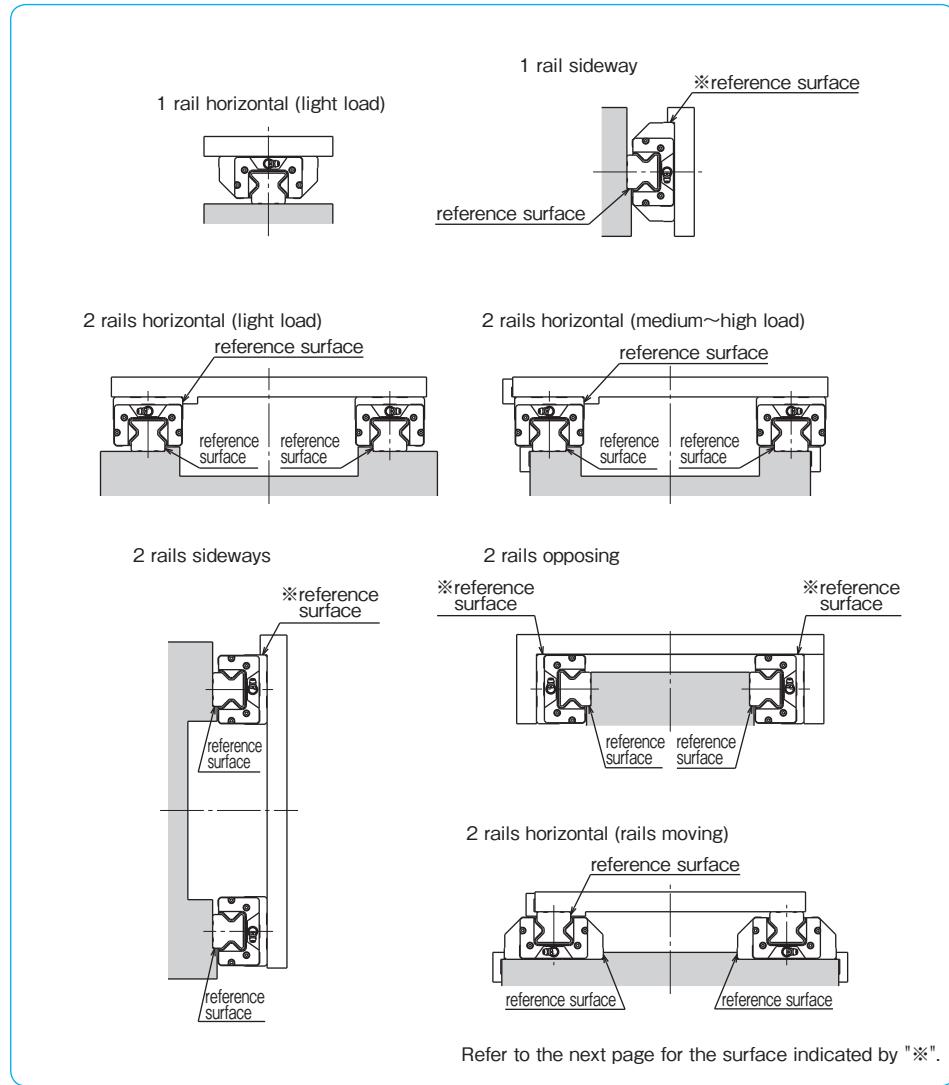

size	M8	M12	M14
recommended torque	27.6	96.4	154

(for steel alloy screws)

MOUNTING METHOD

Since the EXRAIL guides have high load ratings, they can be used in various types of machinery and other equipment in various configurations. Figure X-11 shows some typical EXRAIL guide arrangements.

Figure X-11 EXRAIL Guide Arrangements

Mounting Surface and Accuracy

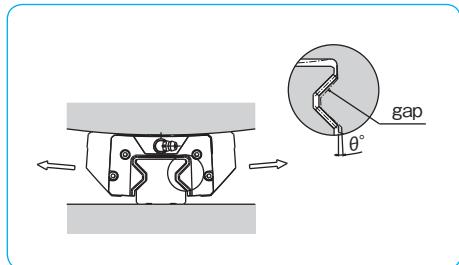

The EXRAIL guides are designed and manufactured to achieve high accuracy after mounting them to a machined mounting base. One typical way is to provide a shoulder on the mounting surface and align the reference surface of the rail or block against the shoulder (page X-7 Figure X10). To avoid corner interference, an undercut should be provided at the shoulder corner. Alternatively, the radius of the shoulder corner should be smaller than the radius of the slide guide block/rail corner.

The accuracy of the rail mounting surface affects the accuracy of the machinery or equipment along with the EXRAIL guide motion accuracy, therefore the accuracy of the mounting surface should be equivalent to the EXRAIL guide motion accuracy.

The specified preload may not be achievable due to deformation of the block if the mounted block surface is not flat (Figure X-12). Please pay close attention to achieve the specified flatness.

Note: Please contact NB for the rail straightness in case the mounting shoulder cannot be provided or the rigidity of the mounting surface is not enough.

Figure X-12 Effect of Flatness

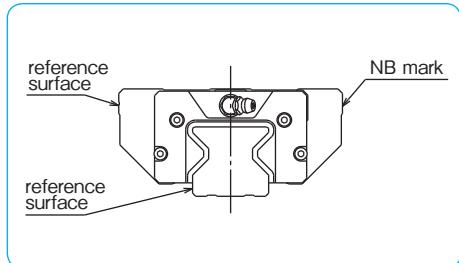

Reference Surface Indication

Reference surfaces are provided on EXRAIL to enable accurate and simplified mounting. They are located on the same side, as shown in Figure X-13, opposite to the NB mark.

Depending on the EXRAIL mounting arrangement, the standard reference surface may not ensure mounting accuracy (for example, 1 rail sideway or 2 rails opposing, page X-8 Figure X-11). In such cases, NB can provide a reference surface on the opposite side. Please specify the side when ordering.

Figure X-13 Reference Surface

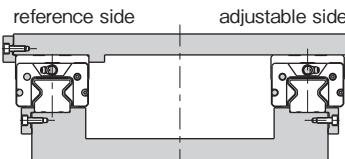

Mounting

In general, the EXRAIL guides are used with 2 rails in parallel. In that case, one rail is on the so-called reference side and the other is on the so-called adjustable side.

- Applications where shock/vibration and high load are involved/high accuracy is required.

The effect of shock and vibration on accuracy is eliminated by using side pieces such as side plates (Figure X-14), tightening set screws (Figure X-15), or tapered gibbs (Figure X-16).

Figure X-14 Using Side Plate

- Applications where light load and low speed are involved.

Figures X-17~19 show the mounting methods when high accuracy is not required or the load capacity of the EXRAIL guide is sufficient due to a light load or low speed. In these cases, side pieces or reference surface may not be required.

Figure X-17 Without Side Piece

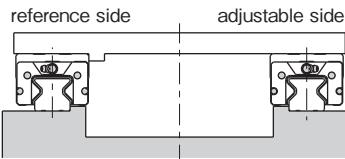

Figure X-18 No Reference Surface on Adjustable Side

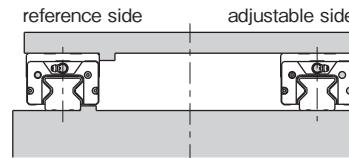

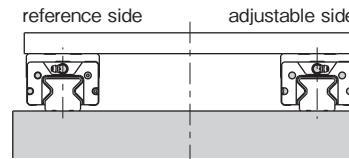

Figure X-19 Without Reference Surface

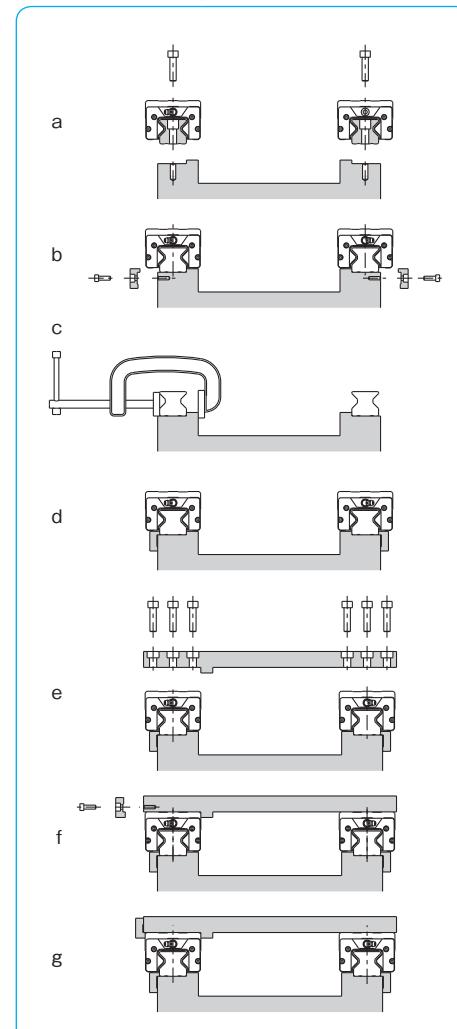

Mounting Procedure

When reference surfaces are provided for both the table and the base, please follow the following procedure to mount the EXRAIL guide.

1. Remove burrs, scratches, dust, etc. from the base and table. Apply a low viscosity oil to the base and the table. Place the EXRAIL guide on the base carefully. Temporarily tighten the rail mounting screws (Figure X-20a).
2. First, install the rail for reference side then tighten the screw for the side piece so that the installation reference surface and the rail reference surface are in close contact (Figure X-20b). If a side piece is not provided, use a C clamp (vise) to position the mounting reference surface and the rail reference surface so that they are in full contact with each other (Figure X-20c).
3. Tighten the mounting screws to the specified torque, and complete the mounting of the reference side rail. The rail is designed so that its accuracy is optimum when the screws are tightened to the specified torque value. Please refer to the recommended torque table for each product type (Figure X-20d).
4. Repeat steps 2 and 3 for mounting the rail on the adjustable side.
5. Move the blocks at the mounting location of the table, and place the table gently. Then slightly tighten the screws (Figure X-20e).
6. Fix the reference surface of the block against the table by the side piece. Tighten the mounting screws in a diagonal sequence (Figure X-20f).
7. In the same manner, tighten the mounting screws for the blocks on the adjustable side (Figure X-20g).
8. Finally, move the table through the entire stroke length to check if accelerate evenly. Please repeat 5 and 6 (2 to 6 when necessary) if acceleration is uneven. If acceleration is even, please do a final tightening of the screws.

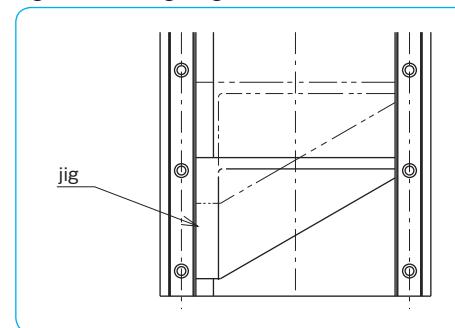

Figure X-20 Mounting Procedure

When the Reference Surface is Not Provided on the Adjustable Side

When a reference surface is not provided on the adjustable side, mount the 2 rails in parallel by using a jig, as mounted in Figure X-21. After mounting the reference-side EXRAIL guide, install the adjustable-side EXRAIL guide by moving the table to achieve parallelism.)

Figure X-21 Using a Jig

When the Reference Surface is Not Provided on the Reference Side

When a reference surface is not provided on the reference side, mount the 2 rails by using a reference surface close to the slide guide.

Temporarily fix the EXRAIL guide to the base, and mount an indicator on a measurement plate. Please fix the measurement plate on two or more blocks (Figure X-22).

Place the indicator against the reference surface of the base. Tighten the screws from one end of the rail to ensure straightness.

If there is no reference surface close-by to EXRAIL, use a straight edge to achieve straightness (Figure X-23).

Figure X-22 Using Base Reference Surface

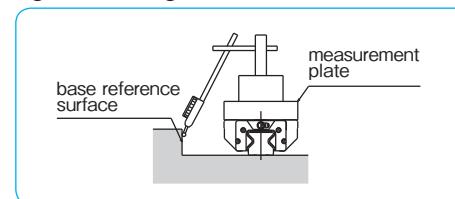

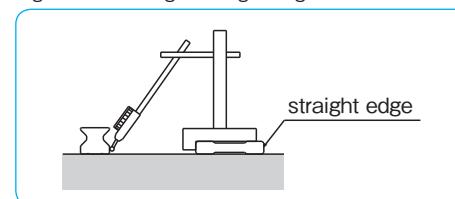

Figure X-23 Using a Straight Edge

DUST PREVENTION

Seals

Side-Seal

The side-seals prevent foreign particles and dust from entering the guide block in order to retain the motion accuracy, resulting in a long lifetime.

Under-Seal

The under-seals prevent foreign particles and dust entering from below depending on EXRAIL installation.

Inner-Seal

In harsh environments the inner-seals prevent foreign particles and dust from entering the guide block in order to retain the motion accuracy and rated product life.

Figure X-24 Seals

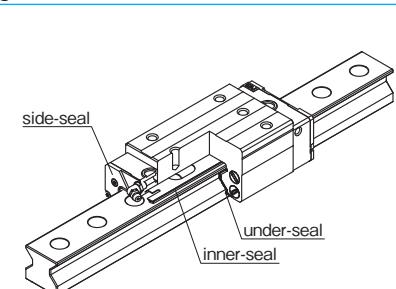

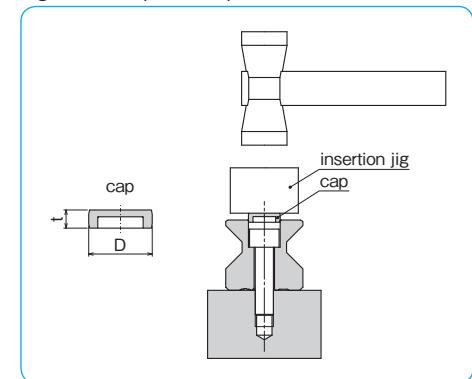

Figure X-25 Special Cap

Special Rail Mounting Caps

For EXRAIL guides, special rail mounting caps as shown in Figure X-25 are available to prevent dust from entering the mounting holes.

These caps are installed, after the rail is fixed to the base, by using a jig and slowly inserting them into the holes until their top surface is flush with the rail surface.

Table X-7 Special Cap

F14	M14	23	5.65	55

GREASE FITTING

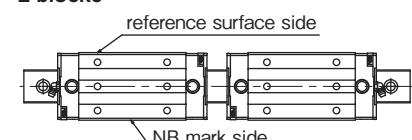

A grease fitting is attached to the return cap of EXRAIL guide blocks for lubrication purposes. Unless otherwise specified, the orientation of the grease fitting is as shown in Figure X-26. When more than 4 blocks are used on one rail, the orientation of the grease fitting is same as the orientation shown in Figure X-26.

Figure X-26 Grease Fitting Orientation

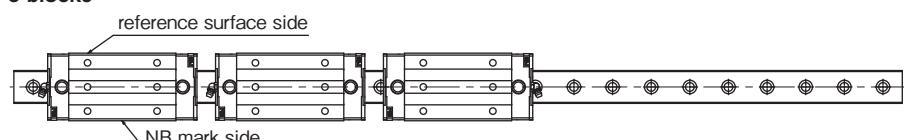

1 block

2 blocks

3 blocks

LUBRICATION

The standard installation of grease fitting for EXRAIL guides is at one front side of return cap. Grease fitting or pipe joint are also possible to be installed at side or top face of return cap (see Figure X-27).

In such cases, machining oil hole or tapped hole will be machined at NB. For lubrication hole dimensions at side and top face, see Table X-8.

When installing grease fitting or pipe joint at top face, O-ring and lubrication spacer is required (see Figure X-28). Please contact NB for details.

USE AND HANDLING PRECAUTIONS

EXRAIL guides are tuned precision components. Please pay special attention to the following notes.

- EXRAIL accuracy is adjusted based on specific block and rail set. It is NOT recommended to remove the block from the rail during installation.
- When block removal is necessary, please use a temporary (plastic dummy) rail to prevent the needle rollers from falling out.
- To remount a guide block on the rail, align the reference surface and the height between the rail and the R mark side of a temporary rail (see Figure X-28). The original combination of the block(s) and rail must be kept. The reference surface of both the block(s) and the rail must be aligned in the original condition.

Figure X-29 How to Remove Guide Block

- Do not reverse the block on the rail to change the grease fitting orientation. Instead, relocate fitting to the opposite end by removing the plug, and re-insert the plug to the original location.
- Never disassemble the block. This will void warranty and support.
- Please remove burrs, dust, or any other debris from the base and table before installation.
- The EXRAIL guides are pre-lubricated for immediate use. Please re-lubricate with the same grade of grease as needed.

SLIDE GUIDE

NB slide guides are high-precision and high-rigidity linear bearings designed to utilize the motion of rolling elements. They have numerous advantageous characteristics including low friction, no stick-slip, and smooth linear motion even under high load conditions. Since they can maintain their high-efficiency and high-functionality characteristics for an extended period of time, they meet a wide range of needs, from general industrial to precision machinery.

ACCURACY MEASUREMENT METHOD

The accuracy of slide guides is measured by fixing the rail to the reference base. The accuracy is expressed in terms of the average value at the center portion.

Dimensional Tolerance and Paired Difference

The accuracy of the slide guide is obtained by measuring the height H , and width W , as shown in Figure A-1. The dimensional tolerance is measured for each of the blocks attached to the rail and is expressed in terms of the deviation from the basic dimension. The paired difference is obtained by measuring the blocks attached to the rail and is expressed in terms of the difference between the maximum and minimum values.

Motion Accuracy

The rail is first fixed to the reference base. The motion accuracy is obtained by measuring the difference in the indicator readings when the block is moved along the entire span of the rail.

Note: Gauge head is placed on the center of the block reference surface.

Notation for Number of Axes and Paired Difference

When more than one rail is used in parallel, the dimensional difference must be measured on more than one block on more than one rail. For measuring the paired difference for height H , please specify the number of axes ($W2$, $W3$) as the part number example shows. For measuring the paired difference for width W , please contact NB.

Note : When four rails are used as illustrated in Figure A-3, W4 should be specified in the part number. Please indicate the number of axes when ordering.

W3: 3 parallel axes

Figure A-3 4 Parallel Axes

RIGIDITY AND PRELOAD

The rolling elements of the slide guide deform elastically due to the applied load. The amount of deformation depends on the type of rolling element. It is proportional to the $2/3$ power for ball elements. For rollers, it is proportional to the $9/10$ power. In either case, the rate of deformation decreases as the applied load increases. Greater rigidity is achieved by applying a preload.

A preload causes internal stress within the slide guide block, resulting in some reduction in lifetime. However, when the guide is used under shock or vibration loading conditions, a preload will absorb the load and will actually help lengthen the life time. Because the preload causes elastic deformation of the rolling elements, it becomes less tolerable to the installation dimensional errors. Extreme care should be exercised in machining the installation surface.

Four levels of preload are available: clearance, standard, light, and medium. This allows the user to select the appropriate level for the application.

Figure A-4 Elastic Deformation of Rolling Elements

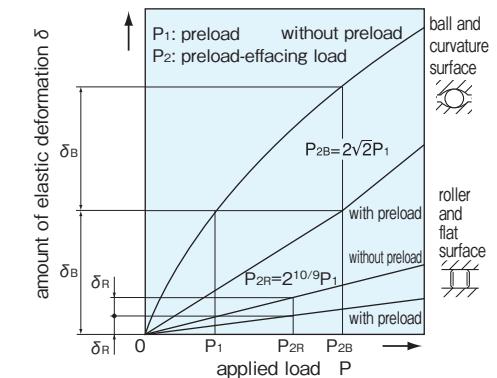

Table A-2 Level of Preload

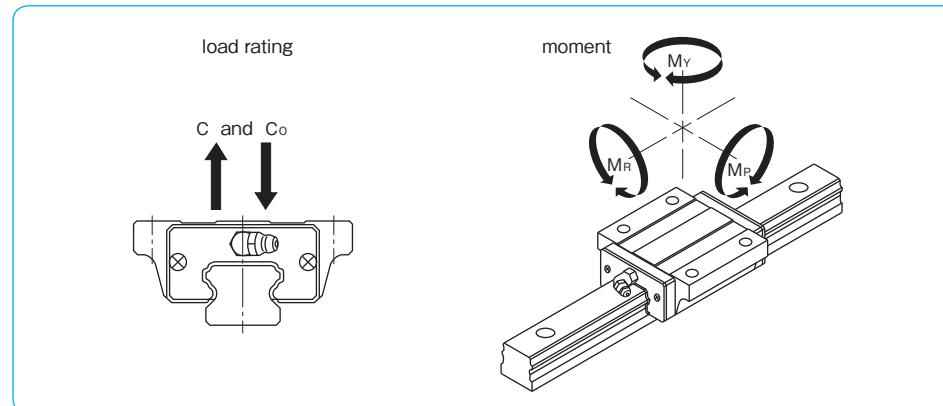

preload	symbol	effect of preload					operating conditions	applicable part number
		vibration absorption ability	self-aligning ability	lifetime	rigidity	frictional resistance		
clearance	T0						light motion is required. installation errors to be absorbed.	SEB
standard	blank						minute vibration is applied. accurate motion is required. moment is applied in a given direction.	SEB, SGL SGW

medium	T2	increases	reduces	reduces	increases	increases	shock and vibration are applied. over-hang load is applied. torsional load is applied.	SGL, SGW

LOAD RATING AND RATED LIFE

Loading Direction and Load Rating

A slide guide experiences load and moment, as shown in Figure A-5. For each load and moment, the basic load ratings and allowable static moments are defined.

Figure A-5 Direction of Load

Rated Life Calculation

Two types of rolling elements are used in NB slide guides: ball and roller elements. There is a different equation for calculating the rated life of each type.

If the stroke length and cycles are constant, life can be expressed in terms of time, the equation is

$$L_h = \frac{L \cdot 10^3}{2 \cdot \ell_s \cdot n_1 \cdot 60}$$

L_h : life time (hr) ℓ_s : stroke length (m)
 L : rated life (km) n_1 : number of cycles per minute (cpm)

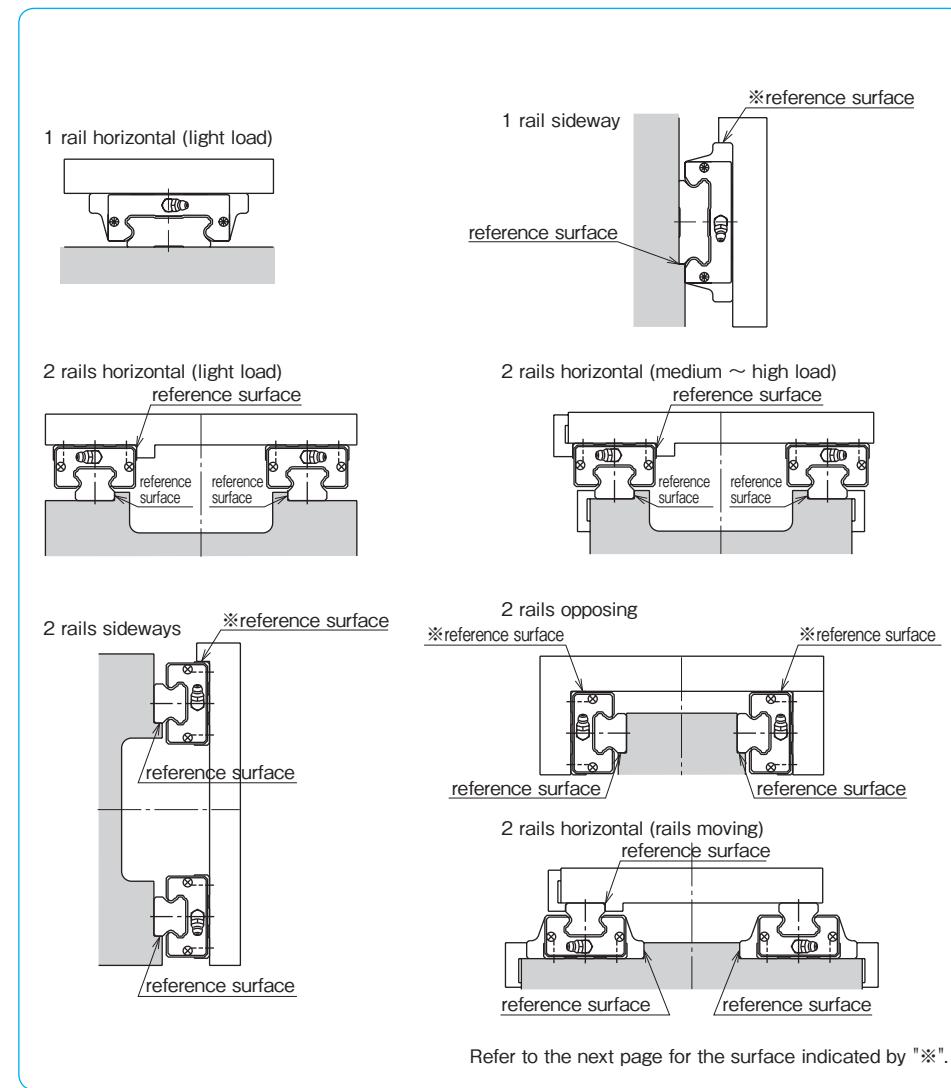

: rated life (km) fc: contact coefficient
 : temperature coefficient fw: applied load coefficient
 C: basic dynamic load rating (N) P: applied load (N)
 * Refer to page Eng-5 for the coefficients.
 * The contact coefficient is applied when two or more
 怀抱 are used in close contact.

blocks are used in close contact.

Mounting

Slide guides have high load ratings in spite of their compact size. They can be used in various types of machinery and other equipment in various configurations. Figure A-6 shows some typical slide guide arrangements.

Figure A-6 Slide Guide Arrangements

Refer to the next page for the surface indicated by "※".

Mounting Surface and Accuracy

NB slide guides are designed and fabricated to achieve high accuracy after mounting them to a machined mounting base. One typical way is to provide a shoulder on the mounting surface and align the reference surface of the rail or block against the shoulder (Figure A-7). To avoid corner interference, an undercut should be provided at the shoulder corner. Alternatively, the radius of the shoulder corner should be smaller than the radius of the slide guide block/rail corner.

The accuracy of the rail mounting surface affects the accuracy of the machinery or equipment along with the slide guide motion accuracy.

The accuracy of the mounting surface should be equivalent to that of the slide guide motion accuracy. The specified preload may not be achieved due to deformation of the block, for example, the mounted block surface is not flat (Figure A-8). Careful attention should therefore be given to achieve the specified flatness.

Note: Please contact NB for the rail straightness in case the mounting shoulder cannot be provided or the rigidity of the mounting surface is not enough.

Reference Surface Indication

Reference surfaces are provided to enable accurate and simplified mounting. They are located on the same side, as shown in Figure A-9, opposite to the NB mark.

Depending on the mounting arrangement, the standard reference surface may not ensure mounting accuracy (for example, 1 rail sideway or 2 rails opposing, Figure A-6, page A-7). In such cases, NB can provide a reference surface on the opposite side. Please specify the side when ordering.

Figure A-7 Profile of Mounting Reference Surface

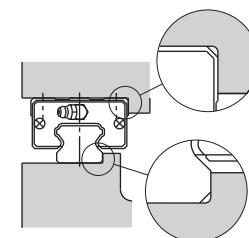

Figure A-8 Effect of Flatness

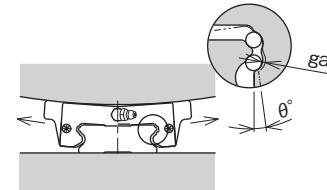

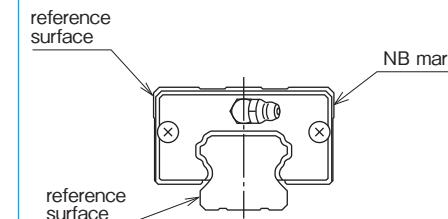

Figure A-9 Reference Surface

Mounting

In general, slide guides are used with 2 rails in parallel. In that case, one rail is on the so-called reference side and the other is on the so-called adjustable side.

- Applications where shock/vibration and high load are involved/high accuracy is required. The effect of shock and vibration on accuracy is eliminated by using side pieces such as side plates (Figure A-10), tightening set screws (Figure A-11), or tapered gibbs (Figure A-12).

Figure A-11 Using Tightening Set Screw

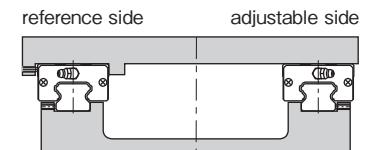

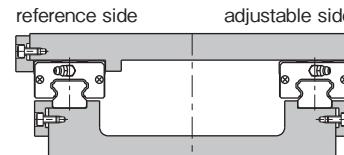

Figure A-10 Using Side Plate

Provide an undercut in the side plate, and fix the table and rail from the side.

- Applications where light load and low speed are involved.

Figures A-13~15 show the mounting methods when high accuracy is not required or the load capacity of the slide guide is sufficient due to a light load or low speed. In these cases, side pieces or reference surface may not be required.

Figure A-12 Using Tapered Gib

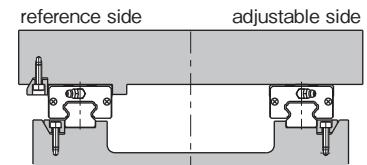

Figure A-14 No Reference Surface on Adjustable Side

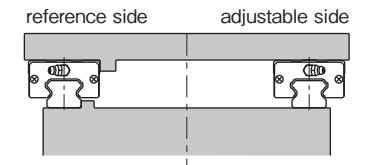

Figure A-13 Without Side Piece

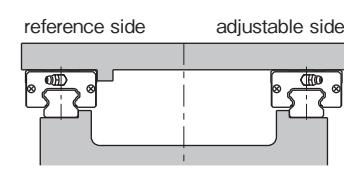

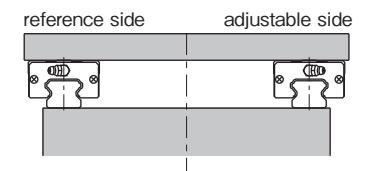

Figure A-15 Without Reference Surface

Mounting Procedure

When reference surfaces are provided for both the table and the base, please follow the following procedure to mount the slide guide.

1. Remove burrs, scratches, dust, etc. from the base and table. Apply a low viscosity oil to the base and the table. Place the slide guide on the base carefully. Temporarily fix the rail mounting screws. (Figure A-16a)

2. Tighten the screw for the side piece so that the installation reference surface and the rail reference surface are in close contact. (Figure A-16b) If a side piece is not provided, use a C clamp to position the mounting reference surface and the rail reference surface so that they contact each other. (Figure A-16c)

3. Tighten the mounting screws to the specified torque, and complete the mounting of the rail. The rail is designed so that its accuracy is optimum when the screws are tightened to the specified value. Please refer to the recommended torque table for each product type. (Figure A-16d)

4. Repeat steps 2 and 3 for the rail on the adjustable side.

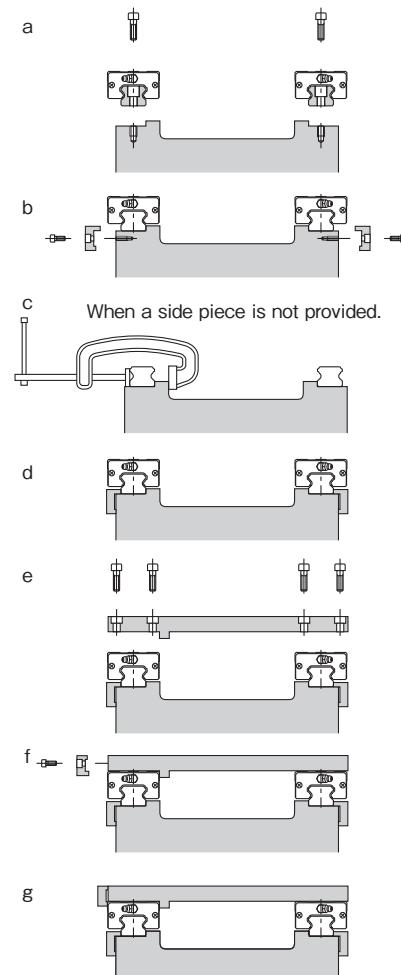

5. Move the blocks at the mounting location of the table, and place the table gently. Then slightly tighten the screws. (Figure A-16e)

6. Fix the reference surface of the block against the table by the side piece. Tighten the mounting screws in a diagonal sequence. (Figure A-16f)

7. In the same manner, tighten the mounting screws for the blocks on the adjustable side. (Figure A-16g)

8. Finally, move the table through the stroke length to check if thrust is even. Please repeat 5 and 6 (2 to 6 when necessary) if thrust is not even. If thrust is even, please do a final tightening of the screws.

Figure A-16 Mounting Method

When the Reference Surface is Not Provided on the Adjustable Side

When a reference surface is not provided on the adjustable side, mount the 2 rails in parallel by using a jig, as mounted in Figure A-17. After mounting the reference-side guide, install the adjustable-side guide by moving the table to achieve parallelism.

Figure A-17 Using a Jig

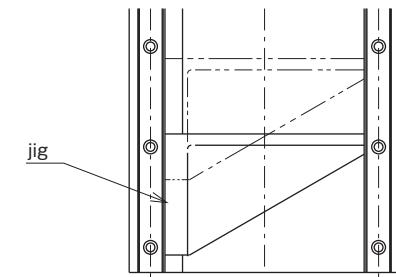

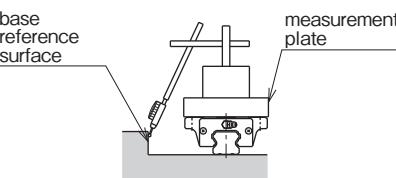

Figure A-18 Using Base Reference Surface

When the Reference Surface is Not Provided on the Reference Side

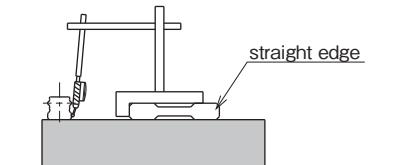

When a reference surface is not provided on the reference side, mount the 2 rails by using a reference surface close to the slide guide.

Temporarily fix the slide guide to the base, and mount an indicator on a measurement plate. Please fix the measurement plate on two or more blocks. (Figure A-18)

Place the indicator against the reference surface of the base. Tighten the screws from one end of the rail to ensure straightness.

If there is no reference surface close-by, use a straight edge to achieve straightness. (Figure A-19)

Figure A-19 Using a Straight Edge

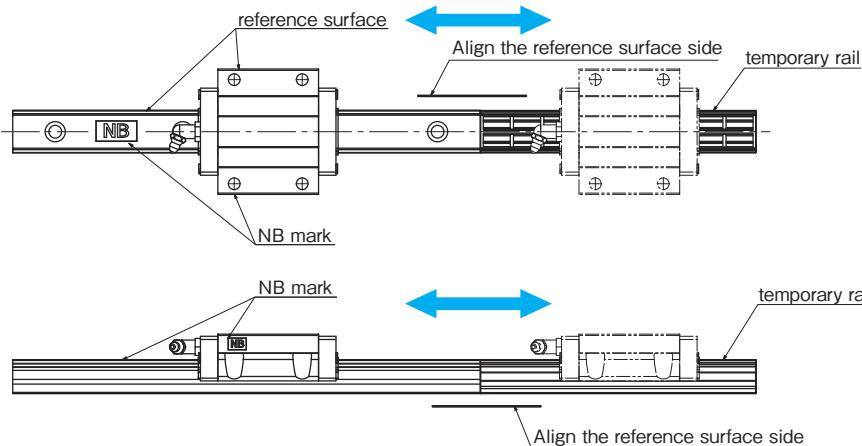

USE AND HANDLING PRECAUTIONS

NB Slide Guides are accurately tuned precision components. Please pay special attention to the following notes.

- Please install the Slide Guide as a set. It is not recommended to remove the block for installation.
- When block removal is necessary, please use a temporary (plastic dummy) rail to prevent balls from dropping out.
- To put a guide block on the rail, as the pictures below show, align the reference surface and the height between the rail and a temporary rail. It is very important to maintain the original combination of block(s) and rail.

Figure A-20 How to Put Guide Block on

- Please do not turn around a block on the rail to change the grease-fitting orientation. Relocate fitting to the opposite end by removing red plug, and re-insert red plug to where fitting was originally.
- Never try to disassemble the block. This will most assuredly void warranty of the product.
- Please remove burrs, dust, or any other debris from the base and table before installation.
- Slide Guides are pre-lubricated for immediate use. Please relubricate with a similar type of grease regularly. Special lubricants must be matched with the same type of grease to prevent contamination.
- The SEB(S) and SER(S) Slide Guides have metal clip stoppers (picture below) to avoid a block fall-out during shipment and assembly. Please remove the stoppers only after installation is finished with a screwdriver as these clips should not be used as 'mechanical' stoppers.

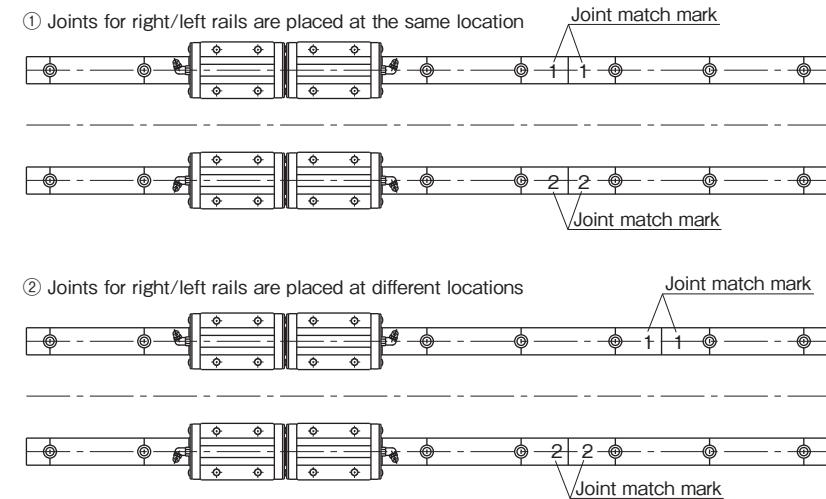

JOINT RAILS

Rails can be joined together to obtain a length which exceeds the maximum length. There are two ways to do this.

- Place the joints at the same location for the right and left rails so as to make the design and maintenance simple (Figure A-21 ①).
- Place the joints for the right and left rails at different locations so that the block does not move over the two joints at the same time so as to minimize the effect of the joint on accuracy (Figure A-21 ②).

Note: Joined rails are available for SGL and SGW series with standard grade, high grade, and with standard preload.
For joined rails on SEB series, please contact NB. Joined rails are not available for SER series.

Figure A-21 Examples of Joined Guide Rails

DUST PREVENTION

The following seals are available for Slide Guide.

Table A-3 SEB type SER type

symbol	Type of Seal
blank	without Side-Seal
UU	Side-Seal

Table A-4 SGL type

symbol	Type of Seal		
blank	Side-Seal		
B	Side-Seal	+	Under-Seal
BW	Double Side-Seal	+	Under-Seal
BS	Side-Seal	+	Under-Seal
BR	Side-Seal	+	Under-Seal
BWS	Double Side-Seal	+	Under-Seal
			Scraper
			Reverse-Seal

Table A-5 SGW type

symbol	Type of Seal
blank	Side-Seal
B	Side-Seal
	+
	Under-Seal

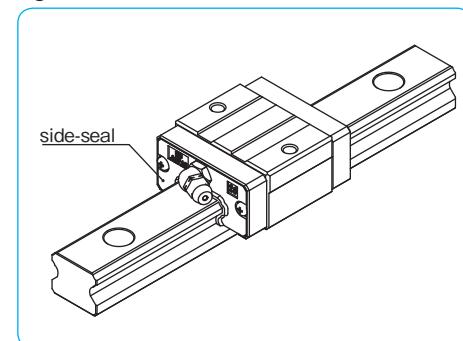

Without Side-Seal (Series: SEB, SER)

When the presence of dust or debris is extremely low and only minor motion resistance is desired, no side-seal option is available. Be aware that, with this option, dust prevention can not be expected.

Side-Seal (Series: SEB, SER, SGL, and SGW)

The side-seals prevent foreign particles and dust from entering the guide block in order to retain the motion accuracy, resulting in a long lifetime.

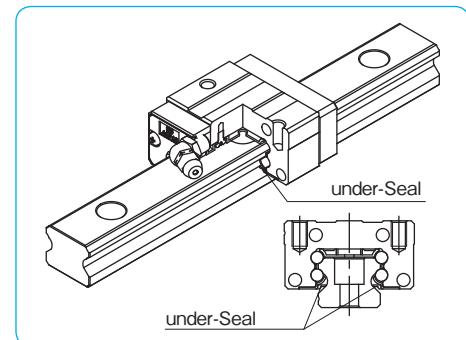

Figure A-22 Side-Seal

Under-Seal (Series: SGL, SGW)

Slide guides with side and under-seals are used in harsh environments or to prevent dust entering from below.

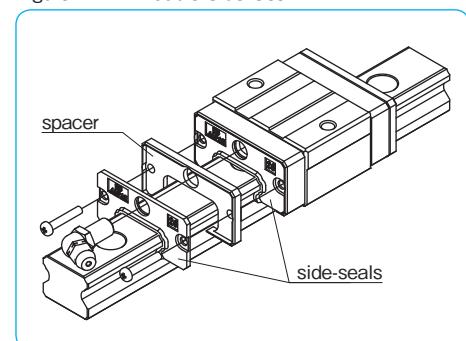

Figure A-23 Under-Seal

Double Side-Seal Option (Series: SGL)

With this option, the prevention against dust is greatly improved. This option is ideal for use in applications where bellows or covers are not able to be fitted over the slide guide system.

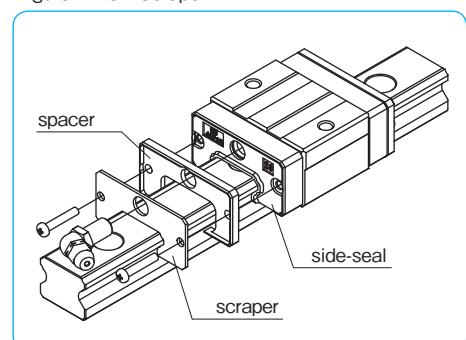

Figure A-24 Double Side-Seal

Scraper Option (Series: SGL)

When the application environment has unfavorable foreign matter or debris the scraper option provides an effectively protective measure for the slide guide system.

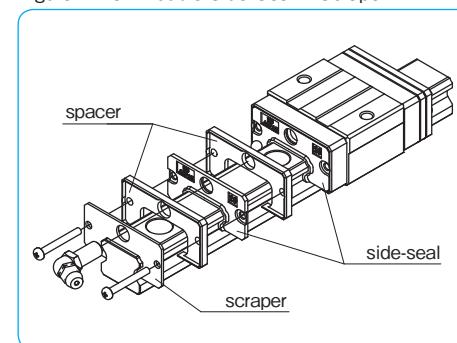

Figure A-25 Scraper

Double Side-Seal + Scraper Option (Series: SGL)

Double side-seal plus scraper is available.

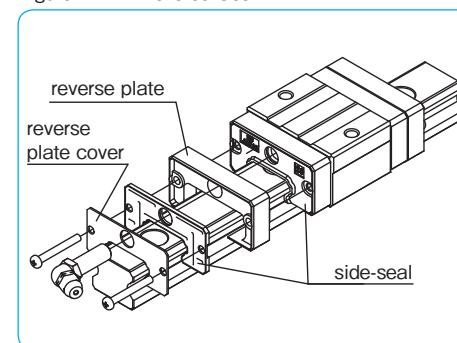

Figure A-26 Double Side-Seal + Scraper

Reverse-Seal (Series: SGL)

NB reverse-seal has another side-seal in the reverse orientation to the block, which achieves maintenance free by reducing grease loss. (refer to page A-19)

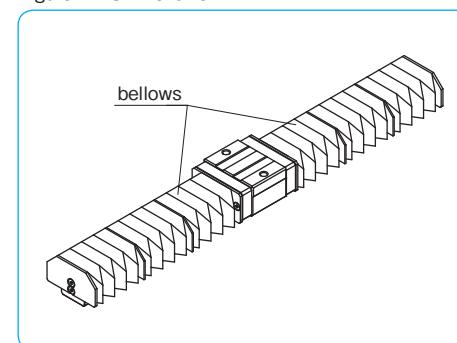

Figure A-27 Reverse-Seal

Bellows (Series: SGL)

This option fully covers the guide rail preventing dust, debris, and other foreign particles from disrupting the smooth linear motion. (refer to page A-20 for further details)

Figure A-28 Bellows

Special Rail Mounting Caps

For SGL and SGW guides, special rail mounting caps are available to prevent dust from entering the mounting holes.

These caps are installed, after the rail is fixed to the base, by using a jig and slowly inserting them into the holes until their top surface is flush with the rail surface.

Figure A-29 Special Cap

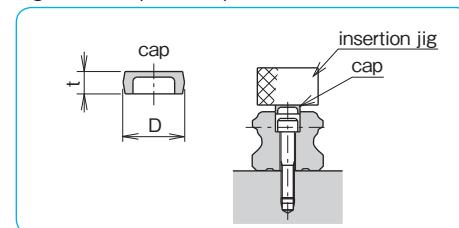

Table A-6 Special Cap

part number	size	dimensions		SGL-F,TF SGL-E,TE	applicable part number

F 6	M 6	11	3	25 30	25	35
F 8	M 8	14	4	30D 35	30 35	—
F12	M12	20	4.65	—	45	—

ANTI-CORROSION

For anti-corrosion, the SEB/SER series and SGL-F/TF types are available in stainless steel material. Low temperature black chrome treatment can be specified for the SGL and SGW series. This treatment (LB) is suitable for applications where corrosion resistance is a requirement.

LUBRICATION

Lithium soap based grease is applied to NB slide guides prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions.

The [Fiber Sheet](#) and Reverse-Seal are available which significantly extends relubrication period (refer to page A-18, A-19).

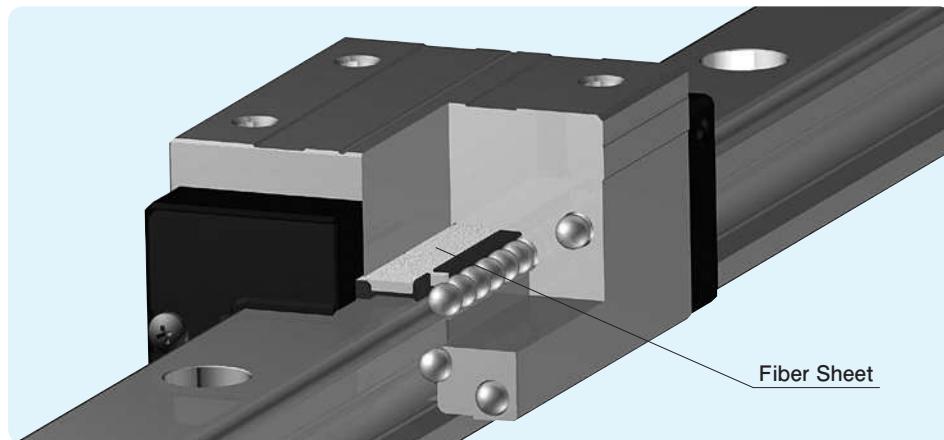

For use in clean rooms or vacuum environments, slide guides without grease or slide guides with customer specified grease are also available. Please contact NB.

NB also provides low dust generation grease. Please refer to page Eng-40 for details.

FIBER SHEET

The Fiber Sheet for the SGL and SGW types, significantly extends lubricant replenishment intervals and has an excellent durability even under harsh conditions with dust and debris that absorb lubricant. Embedded in a block body, as shown in Figure A-30, it does not change the length of the block. In addition, the Fiber Sheet does not require any change in mounting dimensions, which allows replacement with existing products without a design change.

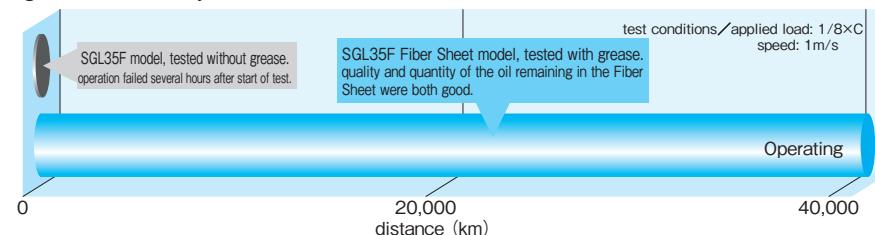

Figure A-30 Magnified View of the Fiber Sheet

Simplified Lubrication Management

NB's Fiber Sheet is a fiber material with a porous structure containing the lubricant oil. The oil is supplied to the ball elements at the proper time and with the proper amount by the principle of capillarity, greatly increasing the relubrication period.

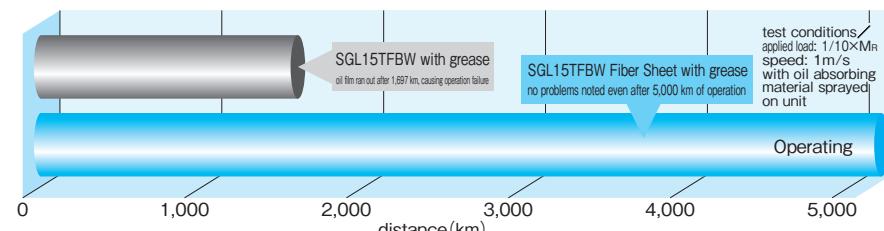

Figure A-31 Durability Test

Outstanding Durability Even Under Poor Operating Conditions

An acceleration test was performed with oil absorbing material sprayed on the units to validate the SGL type's lubrication performance and durability even under poor operating conditions.

Figure A-32 Lubrication Acceleration Test

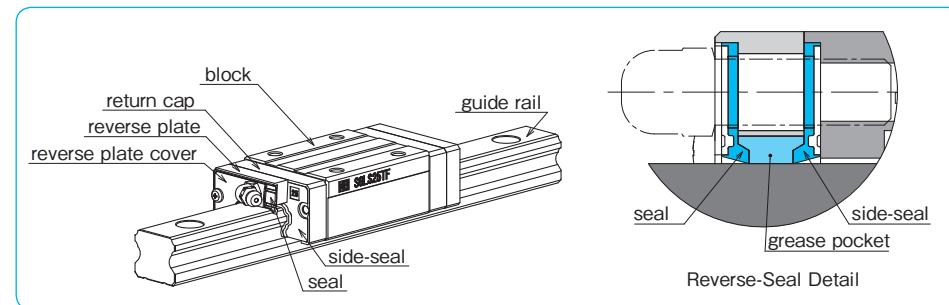

REVERSE-SEAL

Reverse-seal is available on SGL type. NB's Reverse-Seal is a seal unit that consists of reverse plate, seal, and cover.

This seal unit has another side-seal in the reverse orientation to the block, which achieves maintenance free by reducing grease loss.

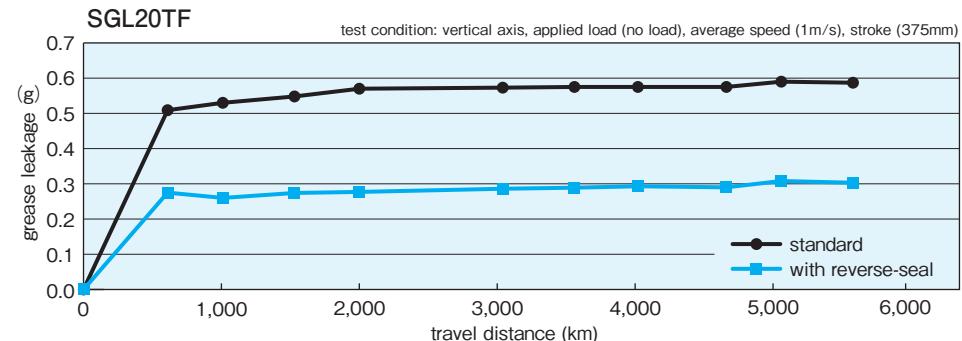

Figure A-33 Reverse-Seal

Reducing Grease Leakage

The space between two seals holds grease to minimize a grease leakage from the block.

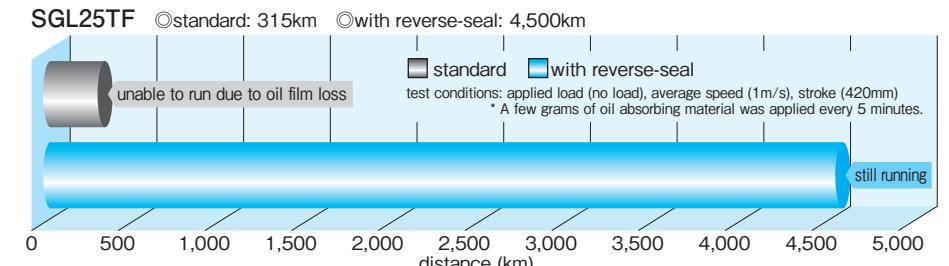

Figure A-34 Grease-leak Test Data

Maintenance Free

Reverse-seal makes a "grease pocket" between two seals that realizes maintenance free by reducing grease leakage and loss.

Figure A-35 Grease Dry-up Test Data

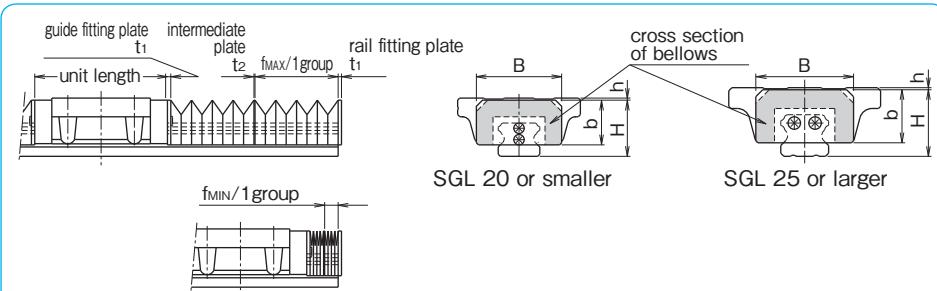

BELLOWS

By protecting the entire length of the guide rail, dust prevention is greatly enhanced.

Please refer to Figure A-36 for dimensions. External dimensions and the stroke length of slide guide will change with use of bellows.

Figure A-36 Dimensions of Slide Guide with Bellows

Note: Please do not unfasten the guide fitting plate screws. The slide guide becomes unfunctional if the guide fitting plate is removed.

	HTE HYE HTEX									50			

Note: 1 group indicates the minimum unit of bellows. Please specify the required stroke length.

When bellows are fitted to the guide block, the grease fitting cannot be installed.

The allowable temperature is up to 60°C if the system has a bellows option.

Please contact NB for details on the installation of bellows, as well as for special application usage.

Calculation Method of Length of Bellows and Slide Guide Rail

Example: In this case, one(1) piece of SGL15TE guide block is mounted on a rail with bellows; the required stroke is 440mm.

Number of groups required for a stroke of 440mm is calculated as follows.

$$\frac{\text{Stroke}}{\text{f}_{\text{MAX}} - \text{f}_{\text{MIN}}} = \frac{440}{32 - 6.5} = 17.2 \approx 18 \text{ groups (round up)}$$

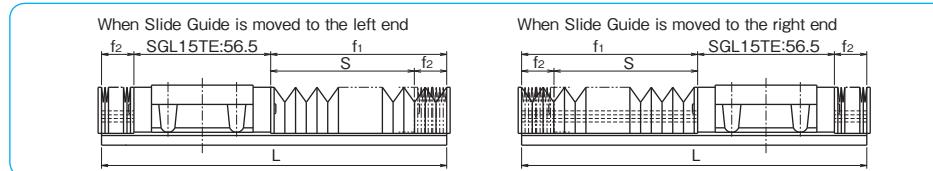

When 18 groups of bellows are fitted, the minimum length f is calculated:

$$f = \text{guide fitting plate} + 1 \text{ group } f_{\text{MIN}} \times \text{number of groups} + \text{intermediate plate} \times (\text{number of groups} - 1) \\ = 1.5 + 6.5 \times 18 + 1.0 \times (18 - 1) = 135.5$$

With these calculation results, length of the guide rail needed (L) is obtained as follows:

$$L = 2 \times f + \text{the required stroke} + \text{unit length} \\ = 2 \times 135.5 + 440 + (56.5 - 2) = 765.5 \approx 766 \text{ (round up)}$$

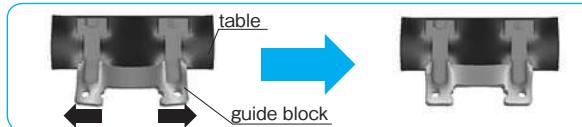

Figure A-37 External Diagram of Slide Guide with Bellows Attached

SEB TYPE AD PROFILE (Anti-Deforming)

The AD profile guide block can dissipate possible deformation by improved installation plane profile.

Figure A-38 SEB type AD profile

Note:

When NB's unique AD Profile type miniature guide block is selected, the following precautions should be taken into consideration to perform to its utmost advantage.

- To obtain maximum AD (Anti-Deforming) effect, flatness of the mounting surface should be finished the same as motion accuracy of the slide guide.
- When the table is designed with one guide block on one guide rail, the utmost AD effect is anticipated.
- All screws on the slide guide block should be tightened to the equal torque value.
- The AD profile type guide block is available only with standard preload.
- AD profile type guide blocks are available only with following part numbers of slide guide block.

*Please contact NB for details.

SLIDE GUIDE Miniature SEB Type

The NB slide guide SEB type is a linear motion bearing in which the ball elements roll along two raceway grooves. This is the smallest and lightest slide guide series offered by Nippon Bearing. The compact design allows for the size and weight of machinery and other equipment to be reduced.

STRUCTURE AND ADVANTAGES

The SEB type slide guide consists of a rail with precisely machined raceway grooves and a block assembly consisting of the main body, return caps and ball elements.

Retained Ball

Because of the ball retainers, the SEBS-B type is able to be removed from the guide rail, simplifying its installation and resulting in lower assembly costs.

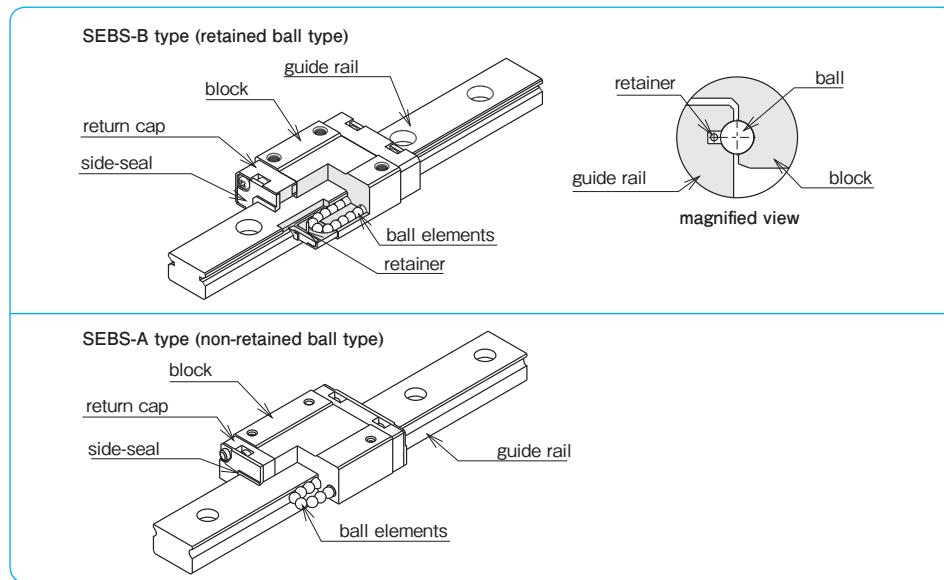

All Stainless Steel Type

By using stainless steel for the return caps, the SEBS-BM type is made from all stainless steel components, making it the ideal choice for special environments such as high temperature, clean room, or vacuum applications.

Moment Resistant

A wide block (WB/WA) type, a long block (BY/AY) type, and a wide/long block (WBY/WAY) type are moment resistant slide guide types. The most

Figure A-39 Structure of SEB type Slide Guide

suitable type can be selected for any demanding operating condition.

Tapped Hole Rail Type

For the SEB rails, counterbore (standard) and optional tapped hole (N) types are available enabling various installation methods.

Compact Design

SEB type has a 2-row, 4-point contact structure. This structure minimizes the installation height, which contributes to light-weight and miniaturization of machinery and equipment.

AD Profile

AD profile dissipates guide block deformation caused by installation. (refer to page A-21)

TYPES

The SEB(S) type slide guides are categorized according to their block shape and the rail installation method.

*All the SEB blocks are made of stainless steel (SEBS marking).

	short block standard type rail(counterbore)	standard block standard type rail(counterbore)	long block standard type rail(counterbore)
	N type rail(tapped hole) 	N type rail(tapped hole) 	N type rail(tapped hole)

standard	blank	minute vibration is applied. accurate motion is required. moment is applied in a given direction.
light*	T1	light vibration is applied. light torsional load is applied. moment is applied.

* Frictional resistance may be affected by preload.

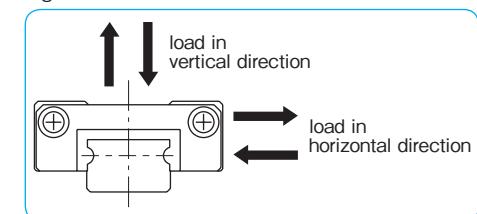

LOAD RATING

The load rating for SEB(S) slide guides depends on the direction of load.

Table A-11 Load Rating

	retained ball type	non-retained ball type
basic dynamic	vertical	$1.00 \times C$
load rating	horizontal	$0.84 \times C$
basic static	vertical	$1.00 \times Co$
load rating	horizontal	$0.84 \times Co$

Figure A-42 Direction of Load

EQUIVALENT LOAD

For a guide to which vertical load and horizontal load are applied at the same time, calculate its static equivalent load using the following equation.

$$P = Pa + X \cdot Ps$$

P: equivalent load Pa: vertical load Ps: horizontal load
X: 0.84 for SEB-A type; 1.19 for SEBS-B type

RAIL LENGTH

Slide guides with most commonly used lengths are available as standard. For slide guides with a non-standard length, unless otherwise specified, the distance from one end of the rail to the first hole center (N) will be within the ranges listed in Tables A-12 and A-13, satisfying the following equation.

$$L = M \cdot P + 2N$$

L: length (mm) M: number of pitches P: hole pitch (mm)
N: distance from the end of the rail to the first hole center (mm)

Table A-12 N Dimension (standard type) unit : mm

MOUNTING

Mounting Surface Profile

Slide guides are mounted by pushing the reference surface of the rail and the block against the shoulder provided on the mounting surface. An undercut or a radius corner should be provided at the corner of the shoulder to prevent interference. The recommended shoulder height values on the mounting reference surface are shown in Table A-14. (Table A-15 for corner radius)

Figure A-44 Mounting Surface Profile-1

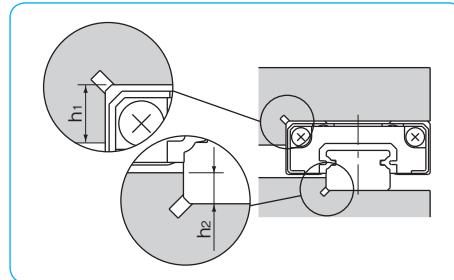

Table A-14 Shoulder Height on the Mounting Reference Surface unit : mm

size	shoulder height on the block side h ₁	shoulder height on the rail side h ₂
2	1	0.5
3	1.2	0.8
5	2	1
7	2.5	
9	3	1.5

5W	2	1
7W	3	1.5
9W		
12W	4	2.5
15W	5	

Recommended Torque Values (Rail)

The screws to fasten the rail should be tightened to an equal torque using a torque wrench in order to secure the motion accuracy. The recommended torque values are given in Table A-16. Please adjust the torque depending on the operating conditions.

Table A-16 Recommended Torque unit : N·m

size	M1	M1.4	M1.6	M2	M2.6	M3	M4	M5	M6
recommended torque	0.03	0.10	0.15	0.3	0.65	1.0	2.3	4.7	8.0

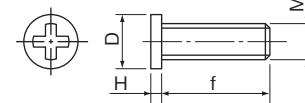

(when using stainless steel screw A2-70)

MOUNTING SCREW

Extremely small custom screws are available from NB.

LUBRICATION

A high grade lithium soap based grease is applied to the NB slide guides prior to shipment for immediate use.

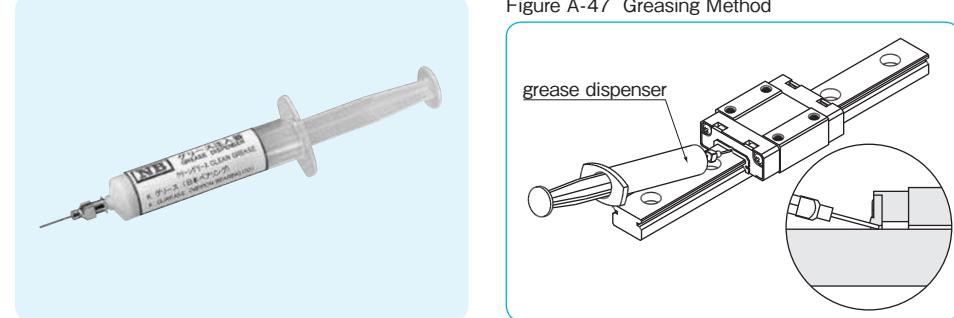

Please relubricate with a similar type of grease periodically depending on the operating conditions. For use in clean rooms or vacuum environments, NB slide guides without grease are available upon request.

Please contact NB for customer specified grease types.

A special syringe lubricant dispenser (refer to Figure A-47) is available from NB as an option. In particular, the SEBS-B retained ball type has a special structure that allows the user to replenish lubricant easily (refer to page Eng-44), as the magnified view of Figure A-47 shows.

Please refer to page Eng-41 for details on the low dust generation grease.

SLIDE GUIDE Miniature SER Type

The NB slide guide SER type is a linear motion bearing utilizing the rolling motion of precision rollers placed in two rows. Despite its compactness, it can be used in various applications requiring high load capacity.

STRUCTURE AND ADVANTAGES

The SER type slide guide consists of a rail with two precision-machined raceway grooves and a block assembly. The block assembly consists of the main body, and rollers. All of these components are made out of metallic materials.

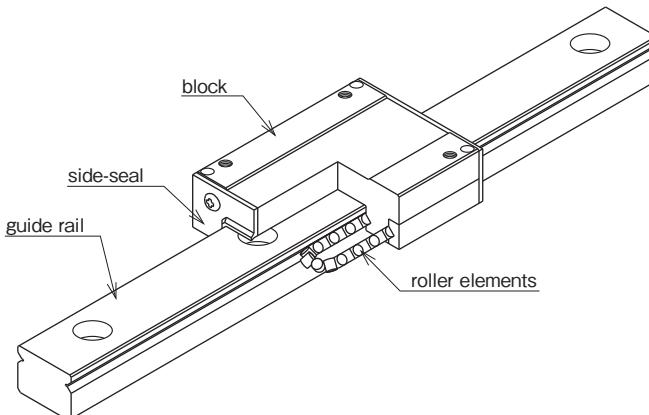

High Load Capacity and Long Life

Since roller elements are used, the contact surface is large which provides a high load capacity and a long travel life.

Compactness

Since a cross roller method is utilized, only two raceway grooves are necessary and presents a very compact package.

Figure A-48 Structure of SER type Slide Guide

Moment Resistant Type

The wide block design (WA type) has an extremely high moment loading capacity. This will allow for single guide designs in the most demanding and compact applications.

Tapped Hole Rail Type

For the SER rails, counterbore (standard) and optional tapped hole (N) types are available enabling various installation methods.

All Stainless Steel Type

The SERS type slide guide is made from all stainless steel components, making it ideal for high temperature, clean room or vacuum applications.

TYPES

The SER type slide guides are available with a standard block or a wide block (WA) configuration. Each type can be selected with standard rails or counterbore holes or the optional N-Type rails of tapped holes. For anti-corrosion, all stainless steel type is also available with all stainless steel components.

PRELOAD

The SER(S) type slide guides are available only with a standard (0 to minimal preload) preload.

RAIL LENGTH

Slide guides with most commonly used lengths are available as standard. For slide guides with a non-standard length, unless otherwise specified, the distance from one end of the rail to the first hole center (N) will be within the ranges listed in Tables A-19 and A-20, satisfying the following equation.

$$L = M \cdot P + 2N$$

L: total length of rail (mm)
N: distance from the end of the rail to the first hole center (mm)
P: hole pitch (mm) M: number of pitches

MOUNTING

Mounting Surface Profile

Slide guides are mounted by pushing the reference surface of the rail and the block against the shoulder provided on the mounting surface. An undercut or a radius corner should be provided at the corner of the shoulder, as shown in Figures A-52 and A-53, to prevent interference. The recommended shoulder height and corner radius are shown in Table A-21 and Table A-22 respectively.

Figure A-52 Mounting Reference Surface Profile-1

Recommended Torque Values

The screws to fasten the rail should be tightened to an equal torque using a torque wrench in order to secure the motion accuracy. The recommended torque values are given in Table A-23. Please adjust the torque depending on the operating conditions.

MOUNTING SCREW

Small screws for the SER(S) type slide guide are available from NB.

LUBRICATION

A high grade lithium soap based grease is applied to the NB slide guides prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions. For use in clean rooms or vacuum environments, NB slide guides without grease are available upon request. Please contact NB for customer specified grease types.

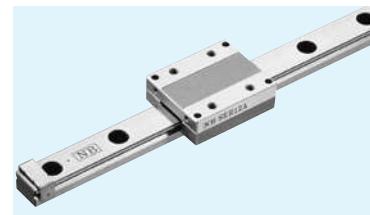

Please refer to page Eng-41 for details on the low dust generation grease.

A special syringe lubricant dispenser is available from NB as an option (refer to page Eng-44).

SLIDE GUIDE SGL TYPE

The NB slide guide SGL type is a linear motion bearing utilizing the rolling motion of ball elements along four rows of raceway grooves. It can be used in various applications due to its compactness and high load capacity.

STRUCTURE AND ADVANTAGES

The NB slide guide SGL type consists of a rail with 4 rows of precisely machined raceway grooves and a block assembly. The block assembly consists of the main body, ball elements, retainers, and return caps.

High Load Capacity and Long Life

The use of relatively large ball elements and raceway grooves machined to a radius close to that of the ball elements increases the contact area resulting in a high load capacity and a long travel life.

Low Friction

Because a 4-row/2-point contact design is used, low friction and stable motion characteristics are achieved even under a preloaded conditions.

Omni-Directional Load Capacity

The ball elements are positioned at 45° contact angle so that the load capacity is equal in four directions (above, below, right and left).

Absorption of Mounting Dimensional Error

Because the ball elements are positioned to increase their self-aligning characteristics, the dimensional error caused during installation is absorbed.

Anti-corrosion Specification

The rail and block assembly can be treated with low temperature black chrome treatment to increase the

corrosion resistance. This treatment is standardized with the symbol "LB". Stainless steel SGSS type is suitable for use in clean room application.

Dust Prevention

Side-seals are provided as a standard. To improve the dust prevention characteristics, under-seals, double-seals, scrapers, bellows and special rail mounting caps are also available.

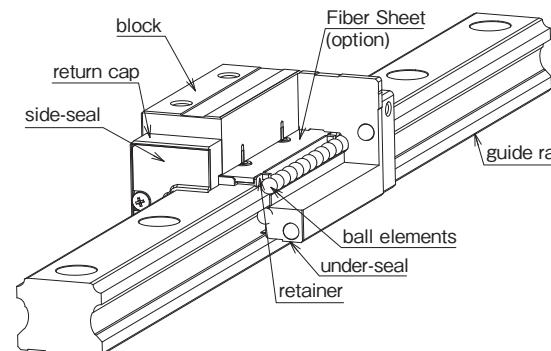

Fiber Sheet Extends Lubricant Replenishment Intervals

A lubricant-containing Fiber Sheet incorporated in the block supplies appropriate amount of lubricant to the raceway grooves at appropriate intervals, which can significantly extend the lubricant replenishment interval. (refer to page A-18)

REVERSE-SEAL

NB Reverse-seal realizes maintenance free by reducing grease leakage and loss. (refer to page A-19)

SGL35	6	8	1
SGL45	8	8	1

GREASE FITTING

A grease fitting is attached to the return cap of SGL type guide blocks for lubrication purposes. Unless otherwise specified, the orientation of the grease fitting is as shown in Figure A-59. When more than 6 blocks are used on one rail, the orientation of the grease fitting is same as the orientation of 3 to 5 block used on one rail.

Figure A-59 Grease Fitting Orientation

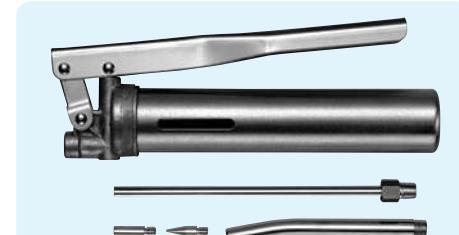

LUBRICATION

A high grade lithium soap based grease is applied to the NB slide guides prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions. For use in clean rooms or vacuum environments, NB slide guides without grease are available upon request. Please contact NB for customer specified grease types.

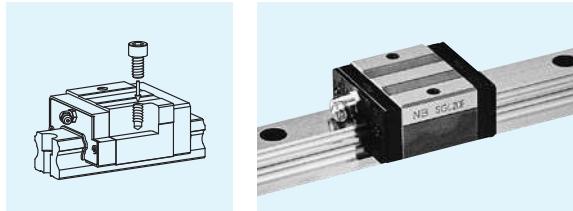

Please refer to page Eng-41 for details on the low dust generation grease.

A Grease Gun Set is available as a maintenance kit (refer to page Eng-44).

SLIDE GUIDE SGW Type

The NB slide guide SGW type is a linear motion bearing utilizing the rolling motion of ball elements along four rows of raceway grooves. Its low height and wide profile makes it suitable for single-rail applications.

STRUCTURE AND ADVANTAGES

The NB slide guide SGW type consists of a rail with four precisely machined raceway grooves and a block assembly. The block assembly consists of the main body, ball elements, retainers, and return caps.

High Load Capacity and Long Life

The raceway grooves are machined to a radius close to that of the ball elements. The larger contact area resulting in a high load capacity and a long travel life.

High Allowable Moment

Its wide profile enables it to sustain high moment loads, making it suitable for single-rail applications.

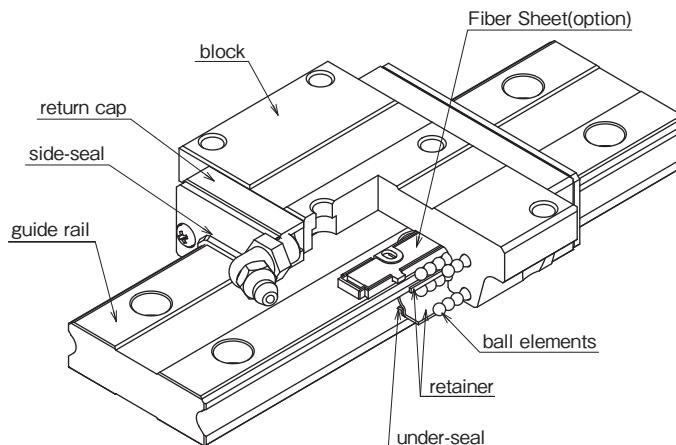

Omni-Directional Load Capacity

The ball elements are positioned at 45° contact angle so that the load capacity is equal in four directions (above, below, right and left).

Smooth Motion

The large number of effective ball elements produce a smooth rolling motion.

medium*	T2	shock and vibration are applied. over-hang load is applied. torsional load is applied.
		*

* Frictional resistance may be affected by preload.

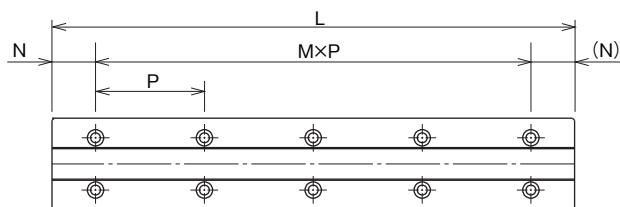

RAIL LENGTH

Slide guides with most commonly used lengths are available as standard. For slide guides with a non-standard length, unless otherwise specified, the distance from one end of the rail to the first hole center (N) will be within the range listed in Table A-34, satisfying the following equation.

$$L = M \cdot P + 2N$$

L: length (mm) M: number of pitches P: hole pitch (mm)
N: distance from the end of the rail to the first hole center (mm)

Figure A-64 Rail

MOUNTING

Slide guides are generally mounted by pushing the reference surface of the rail and block against the shoulder of the mounting surface. To avoid interference between the shoulder and the corner of the rail or block, the recommended dimensions are listed in Table A-36.

The screws to fasten the rail should be tightened to an equal torque using a torque wrench in order to secure the motion accuracy. The recommended torque values are given in Table A-35. Please adjust the torque depending on the operating conditions.

Table A-35 Recommended Torque unit : N·m

size	M4	M6
recommended torque	3.2	11.2

BALL SPLINE

The NB ball spline is a linear motion mechanism utilizing the rolling motion of ball elements that can sustain loads and transfer torque simultaneously. It can be used in a wide variety of applications including robotics and transport type equipment.

STRUCTURE AND ADVANTAGES

The NB ball spline consists of a spline shaft with raceway grooves and a spline nut. The spline nut consists of an outer cylinder (main body), retainer, side rings, and ball elements that is designed and manufactured to achieve a reliably smooth motion.

High Load Capacity and Long Travel Life

The raceway grooves are machined to a radius close to that of the ball elements. The large ball contact area results in high load capacity and long travel life.

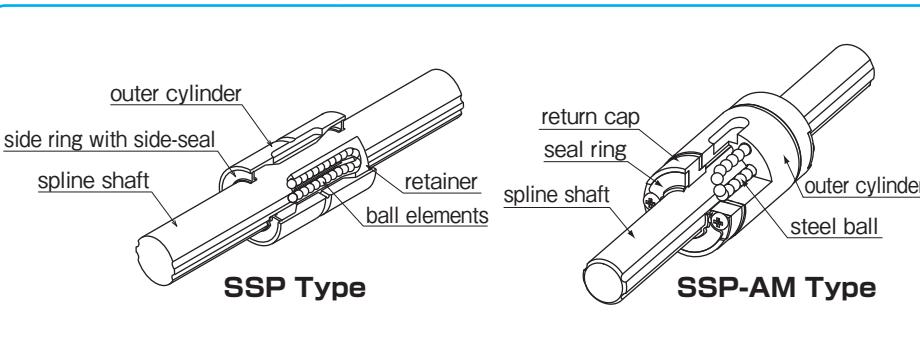

Wide Variety of Configurations

Spline shaft sizes with diameters from 4mm to 100mm are available. Several types of Spline nut are available: cylindrical types (SSP/SSPM), and flange types (SSPF/SSPT). Material option of Stainless steel (SUS440C or equivalent) is also available. They can be specified to suit various applications.

High Accuracy Torque Transmission

Due to the effective contact angle between the raceway grooves and the balls, the NB ball spline can transfer large torque. By adjusting preload it is possible to obtain a higher rigidity and a higher positioning accuracy.

Figure B-1 Basic Structure of NB Ball Spline

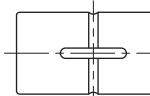

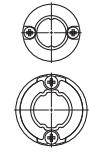

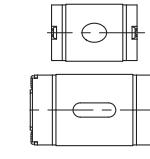

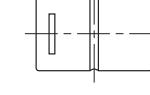

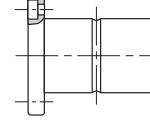

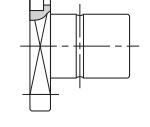

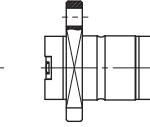

TYPES

TYPES OF SPLINE NUT

A wide variety of spline nut designs are available and all spline nuts come with side-seals as a standard feature.

Table B-1 Types of Spline Nut

type of nut	shape and advantage		page
cylindrical type	SSP SSPS	  <ul style="list-style-type: none"> cylindrical spline nut with key groove with special key nominal diameter: SSP4-100 : SSPS4-25 	P.B-18

flange type	SSPT-AM SSPK-AM SSPTS-AM SSPKS-AM	  <ul style="list-style-type: none"> light and compact nut with flange nominal diameter: 4-10 	P.B-28

TYPES OF SPLINE SHAFT

Depending on the application requirements, either a ground spline shaft or a non-ground (commercial grade) spline shaft is available.

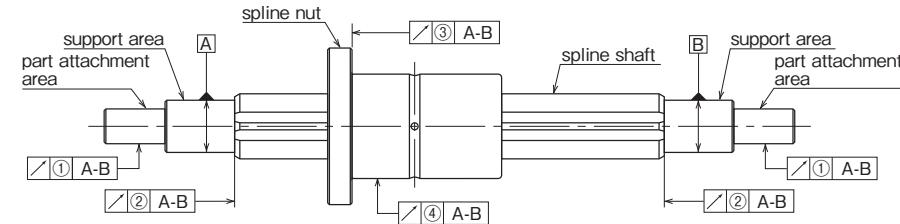

Table B-2

type of spline shaft	shape and advantage
ground spline shaft	 <ul style="list-style-type: none"> precision ground and precision machined surface finish high precision possible to machine ends of spline shaft and surface treatment nominal diameter: 4-100
commercial shaft (non-ground)	 <ul style="list-style-type: none"> for general industrial use cost effective possible to machine ends of spline shaft and surface treatment nominal diameter: 20-50 maximum length: 5000mm (refer to page B-31)

ACCURACY

The NB ball spline is measured for accuracy at the points shown in Figure B-2 and categorized as either high-grade (blank) or precision-grade (P). Contact NB for accuracy information on the commercial type ball spline.

Figure B-2 Accuracy Measurement Points

Note: The support area is the portion where, for example, radial bearings are attached in order to support the spline shaft.

The part attachment area is the portion to which other parts, such as gears are attached.

Tolerance of Spline Shaft Groove Torsion (Max.)

The groove torsion is indicated per 100mm, arbitrarily set as the effective length of the spline shaft section.

★★ Please contact NB for shaft lengths exceeding 2000mm.

PRELOAD AND CLEARANCE IN ROTATIONAL DIRECTION

Both the clearance and preload are expressed in terms of clearance in the rotational direction. The preload is categorized into three different levels: standard, light (T1), and medium (T2). A preload cannot be specified with the commercial grade spline shaft.

Table B-6 Preload and Clearance in Rotational Direction unit: μm

part number	standard	light (T1)	medium (T2)
SSP 4 · 4AM

SSP100A	-8~+4	-24~ -8	-40~ -24
SSP100AL			

Table B-7 Preload and Operating Condition

preload	preload symbol	operating conditions
standard	blank	minute vibration is applied. a precise motion is required. a torque in a given direction is applied.
light	T1	slight vibration is applied. slight torsional load is applied. cyclic torque is applied.
medium	T2	shock/vibration is applied. over-hang load is applied. torsional load is applied.

※Since the contrary relation of preload and dynamic frictional resistance, dynamic frictional resistance will increase when applying preload.

STRENGTH OF SPLINE SHAFT

The ball spline has larger load ratings compared to ball bush. Also, the ball spline can sustain radial load, moment (bending moment) and torque (twisting moment) at the same time. Thus, it is necessary to consider the strength of ball spline shaft.

Using the following equations, select the size of ball spline.

$$\sigma \geq \frac{M}{Z} \quad \dots \dots \dots (1)$$

σ : permissible bending stress of spline shaft(98N/mm^2)
M: bending moment onto spline shaft($\text{N}\cdot\text{mm}$)
Z: modulus of section(mm^3)
(refer to Table B-8 on page B-8)

Twisting Moment Only

$$\tau_a \geq \frac{T}{Z_p} \quad \dots \dots \dots (2)$$

τ_a : permissible twisting stress of spline shaft(49N/mm^2)
T: twisting moment onto spline shaft ($\text{N}\cdot\text{mm}$)
 Z_p : polar modulus of section(mm^3)
(refer to Table B-8 on page B-8)

Bending Moment and Twisting Moment Combined

Calculate equivalent bending moment (M_e) by using equation (3). Then, substitute M_e into equation (1) for shaft size selection.

$$M_e = \frac{1}{2} \left\{ M + \sqrt{(M^2 + T^2)} \right\} \quad \dots \dots \dots (3)$$

M_e : equivalent bending moment($\text{N}\cdot\text{mm}$)
M: bending moment onto spline shaft
T: twisting moment onto spline shaft

Rigidity of Spline Shaft

The rigidity of spline shaft is expressed in the torsional angle (θ) caused by twisting moment.
For high accuracy smooth motion, it is necessary to keep the torsional angle within 0.25° per 1,000mm.

$$\theta = \frac{T \cdot L}{G \cdot I_p} \cdot \frac{360}{2\pi} \quad \dots \dots \dots (4)$$

$$\text{Rigidity} = 0.25^\circ \geq \frac{1,000}{L} \theta \quad \dots \dots \dots (5)$$

θ : torsional angle ($^\circ$)
T: twisting moment onto spline shaft ($\text{N}\cdot\text{mm}$)
L: spline shaft length(mm)
G: shearing modulus(SUJ2) $7.9 \times 10^4 (\text{N/mm}^2)$
(SUS) $7.69 \times 10^4 (\text{N/mm}^2)$
 I_p : polar moment of inertia of area(mm^4)
(refer to Table B-8 on page B-8)

LOAD RATING

The load rating for SSP-AM type depends on the direction of load.

Table B-9 LOAD RATING

	SSP4AM	SSP5AM~10AM
basic dynamic load rating	vertical C	C
	horizontal 1.73×C	1.22×C
basic static load rating	vertical C ₀	C ₀
	horizontal 1.73×C ₀	1.22×C ₀

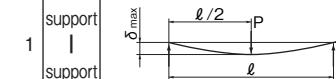

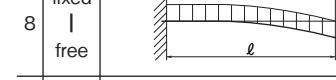

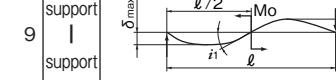

Figure B-6 Load Direction

CALCULATION OF DEFLECTION AND DEFLECTION ANGLE OF SPLINE SHAFT

The following formulas are used to obtain the deflection and its angle of the ball spline shaft. Typical conditions are listed in Table B-10.

Table B-10 Formulas for Calculating Deflection and Deflection Angle

support method	specification	formula for deflection	formula for deflection angle
1 support I support		$\delta_{\max} = \frac{P\ell^3}{48EI} = P\ell^3C$	$i_1 = 0$ $i_2 = \frac{P\ell^2}{16EI} = 3P\ell^2C$
2 fixed I fixed		$\delta_{\max} = \frac{P\ell^3}{192EI} = \frac{1}{4}P\ell^3C$	$i_1 = 0$ $i_2 = 0$
3 support I support		$\delta_{\max} = \frac{5p\ell^4}{384EI} = \frac{5}{8}p\ell^4C$	$i_2 = \frac{p\ell^3}{24EI} = 2p\ell^3C$
4 fixed I fixed		$\delta_{\max} = \frac{p\ell^4}{384EI} = \frac{1}{8}p\ell^4C$	$i_2 = 0$
5 support I support		$\delta_1 = \frac{Pa^3}{6EI} \left(2 + \frac{3b}{a}\right) = 8Pa^3 \left(2 + \frac{3b}{a}\right)C$ $\delta_{\max} = \frac{Pa^3}{24EI} \left(\frac{3\ell^2}{a^2} - 4\right) = 2Pa^3 \left(\frac{3\ell^2}{a^2} - 4\right)C$	$i_1 = \frac{Pab}{2EI} = 24PabC$ $i_2 = \frac{Pa(a+b)}{2EI} = 24Pa(a+b)C$
6 fixed I fixed		$\delta_1 = \frac{Pa^3}{6EI} \left(2 - \frac{3a}{\ell}\right) = 8Pa^3 \left(2 - \frac{3a}{\ell}\right)C$ $\delta_{\max} = \frac{Pa^3}{24EI} \left(2 + \frac{3b}{a}\right) = 2Pa^3 \left(2 + \frac{3b}{a}\right)C$	$i_1 = \frac{Pa^2b}{2EI\ell} = 24Pa^2bC$ $i_2 = 0$
7 fixed I free		$\delta_{\max} = \frac{P\ell^3}{3EI} = 16P\ell^3C$	$i_1 = \frac{P\ell^2}{2EI} = 24P\ell^2C$ $i_2 = 0$
8 fixed I free		$\delta_{\max} = \frac{p\ell^4}{8EI} = 6p\ell^4C$	$i_1 = \frac{p\ell^3}{6EI} = 8p\ell^3C$ $i_2 = 0$
9 support I support		$\delta_{\max} = \frac{\sqrt{3}Mo\ell^2}{216EI} = \frac{2\sqrt{3}}{9}Mo\ell^2C$	$i_1 = \frac{Mo\ell}{12EI} = 4Mo\ell C$ $i_2 = \frac{Mo\ell}{24EI} = 2Mo\ell C$
10 fixed I fixed		$\delta_{\max} = \frac{Mo\ell^2}{216EI} = \frac{2}{9}Mo\ell^2C$	$i_1 = \frac{Mo\ell}{16EI} = 3Mo\ell C$ $i_2 = 0$

δ_1 : deflection at the concentrated load point (mm) δ_{\max} : maximum deflection (mm) i_1 : deflection angle at the concentrated load point (rad) i_2 : deflection angle at the support point (rad) Mo : moment (N·mm) P : concentrated load (N) p : uniformly distributed load (N/mm) a, b : concentrated load point distance (mm) ℓ : span (mm) I : moment of inertia of area (mm⁴) (refer to Table B-8 on page B-8) E : modulus of longitudinal elasticity (SUJ2) 2.06×10⁵ (N/mm²) (SUS) 2.0×10⁵ (N/mm²) C : 1/48EI (1/N·mm²)

OPERATING CONDITIONS

The performance of the ball spline is affected by the operating conditions of the application. The operating conditions should, therefore be carefully taken into consideration.

Dust Prevention

Foreign particles or dust in the ball spline nut affects the motion accuracy and shortens the life time. Standard seals will perform well against dust prevention under normal operating conditions; however, in a harsh environment, it is necessary to attach bellows or protective covers. (refer to Figure B-10)

Operating Temperature

Since the retainer is made of resin, the operating temperature should never exceed 80°C.

LUBRICATION

The spline nut is prelubricated with lithium soap based grease prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions.

Low dust generation grease is available from NB standard grease. (refer to page Eng-40)

The NB spline nut has seals as standard. The seals work well to contain the grease inside the nut especially for the ground shaft, since the seal shape approximates the spline shaft profile.

Figure B-10 Example of Dust Prevention

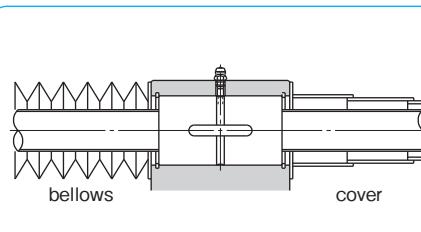

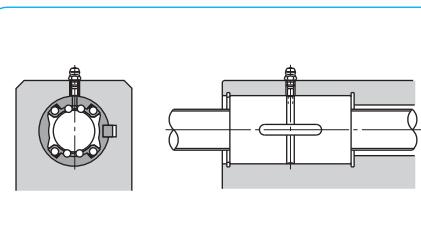

Figure B-11 Example of Lubrication Mechanism

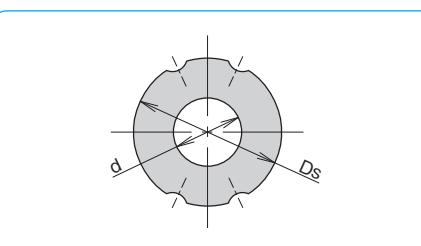

HOLLOW SPLINE SHAFT

NB provides hollow shafts. It can be used for running cable, air piping, and weight reduction. Table B-12 shows a list of recommended inner diameter for hollow spline shaft (SUJ2).

Table B-14

Recommended Inner Diameter for Hollow Spline Shaft

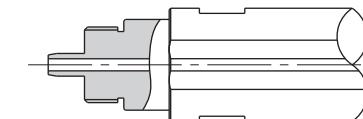

part number	shaft diameter Ds mm	inner diameter d mm	cross-sectional coefficient Z mm ³	second moment of inertia I mm ⁴

SPECIAL REQUIREMENTS

Based on customer drawings and requirements NB offers shaft-end machining, spline nut machining, surface treatment, etc. Please contact NB for special requirements.

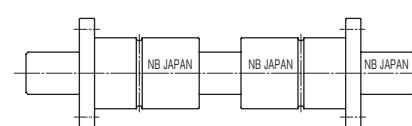

Figure B-12 Example of Shaft-end Machining

NUT ORIENTATION

Unless otherwise specified, the orientation of two NB ball spline nuts SSPM, SSPF, SSPT and SSPT(K)-AM type is shown in Figure B-13. In other cases please specify the orientation of nut(s) with shaft.

Figure B-13 Nut Orientation and NB mark

USE AND HANDLING PRECAUTIONS

NB ball spline must be handled with care as it is a precise component. Please note the following points.

A Set of Spline Nut and Spline Shaft

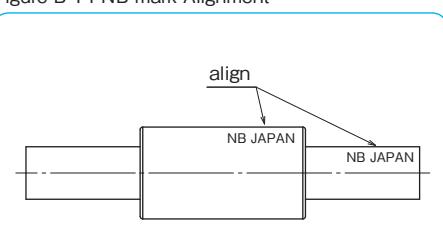

The ball spline's accuracy and preload is guaranteed when spline nut and shaft are aligned as shown in Figure B-12. Please make sure to align the NB marks when reinserting the shaft.

When inserting the spline shaft into the spline nut, ensure that the ball elements do not drop out. This is done by aligning the raceway grooves of the shaft with the rows of ball elements and the seal lip of the nut. Then, carefully insert the spline shaft through the spline nut. In case that the nut is preloaded, please exercise additional care.

Excessive Moment

One spline nut can sustain high moments, however, excessive moment makes the spline nut unbalanced and unstable during motion. Please use more than one spline nut for high moment or high accuracy applications.

Figure B-14 NB mark Alignment

MOUNTING

Mounting of SSP Type

Examples of installing the SSP type are shown in Figures B-15 and B-16.

Figure B-15 Using a Retaining Ring

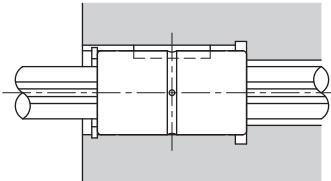

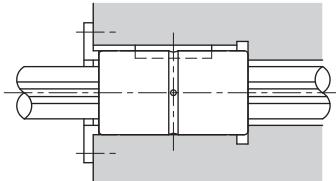

Figure B-16 Using a Push Plate

Key

The SSP and SSP-AM type spline nut come with a key shown in Figure B-17.

Figure B-17 Key for SSP Type

• Tolerance of total length

total length up to 4,000: JIS B0405 coarse grade
total length greater than 4,000: $\pm 5.0\text{mm}$

Please specify tolerances when required.

• Please refer to dimension tables for nut shape and dimensions.

• When a commercial shaft is used, the load rating of the nut is approximately 70% of indicated rating in the dimension tables.

ROTARY BALL SPLINE

The NB rotary ball spline can be used for both rotational motion and linear motion. The applications include SCARA robots, vertical shaft of assembly equipment, tool changers, and loaders, etc.

STRUCTURE AND ADVANTAGES

The NB Rotary Ball Spline nut consists of a spline nut and a rotating portion using either cross rollers for SPR or balls for SPB.

High Accuracy

Ball Splines transfer torque and achieve accurate positioning in the linear direction.

By adding the rotating portion, Rotary Ball Splines can achieve accurate positioning in the linear and rotational directions.

Half the Parts, Reduction in Installation Cost

The Spline nut and rotary bearing are combined in order to significantly reduce the number of parts, compared to conventional system.

The combination also reduces the housing thickness to a minimum, resulting in light weight and easy installation.

Figure B-27 Structure of SPR type

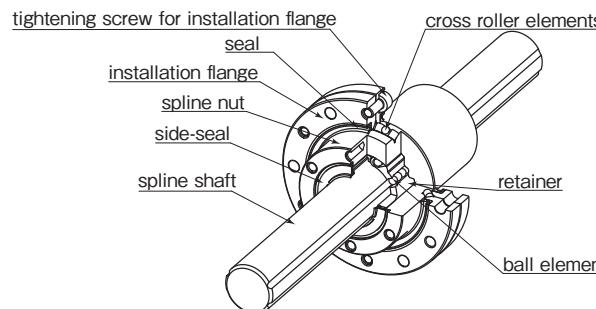

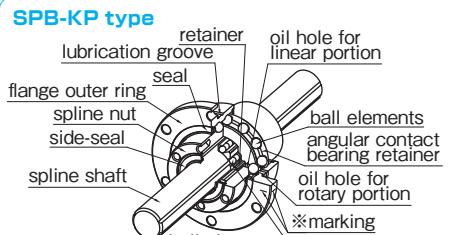

Figure B-28 Structure of SPB-KP type and SPB type

*When lubricating linear portion, both oil hole linear and rotary can match by aligning the raceway grooves of the shaft with the marking of flange outer ring.

Compact and High Rigidity(SPR type)

The cross rollers are directly attached to the ball spline's outer cylinder, resulting in a compact and light design.

SPR type has high rigidity despite its compactness. The tool changer is one typical application.

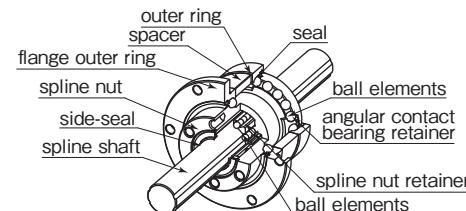

High Rigidity and High Speed(SPБ type)

SPB type is a combination of a spline nut and angular contact bearings.

The rotary portion is a set of angular contact bearings which are aligned in the back-to-back duplex manner.

SPB type can bear radial, axial, and moment loads in a well-balanced way, thus best suited to high speed rotational applications.

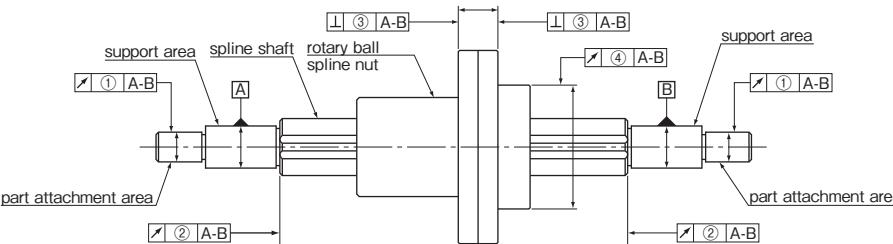

SPB type

ACCURACY OF SPR TYPE

The accuracy of SPR type is measured at the points shown in Figure B-29.

Figure B-29 Accuracy Measurement Points

Note: The support area is the portion where, for example, radial bearings are attached in order to support the spline shaft.
The part attachment area is the portion to which other parts, such as gears are attached.

Tolerance of Spline Shaft Groove Torsion (Max.)

The groove torsion is indicated per 100mm, arbitrarily set as the effective length of the spline shaft section.

Table B-19 Tolerance of Spline Shaft Groove Torsion (Max.)

	SPB25KP,25	—	—	—

Please contact NB for other than preload standards above.

Table B-28 Preload and Operating Conditions

preload	symbol	operating conditions
standard	blank	minute vibration is applied. a precise motion is required.
		moment is applied in a given direction.
light	T1	light vibration is applied. light torsional load is applied. cyclic torque is applied.
medium	T2	shock/vibration is applied. over-hang load is applied. torsional load is applied.

*Frictional resistance may be affected by preload.

HOLLOW SPLINE SHAFT

NB provides hollow shafts. It can be used for running cable, air piping, and weight reduction. Table B-29 shows a list of recommended inner diameter for hollow spline shaft (SUJ2).

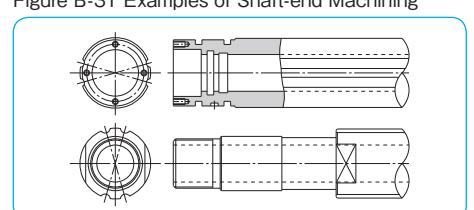

Table B-29 Recommended Inner Diameter for Hollow Spline Shaft

	outer diameter Ds mm	inner diameter d mm	second moment of inertia I mm ⁴	cross-sectional coefficient Z mm ³
SPR_6	SPB_6KP	6	2	58.3
SPR_8	SPB_8KP	8	3	186
SPR10	SPB10KP	10	4	448
SPR13	SPB13KP	13	6	1,260
SPR16	SPB16KP,16	16	8	2,780
SPR20A	SPB20KP,20	20	10	6,860
SPR25A	SPB25KP,25	25	15	15,400

SPECIAL REQUIREMENTS

NB provides customization such as shaft-end machining, spline nut machining, and surface treatment per customer requests. Please contact NB for the inner diameter of SPR20~SPR60.

Figure B-31 Examples of Shaft-end Machining

MOUNTING

The flange attachment screws of SPR type have been pre-adjusted for smooth rotary movement and should never be loosened. Shock loading to the flange assembly should be avoided as this can degrade the accuracy of movement and deteriorate the overall performance.

The spacer of SPB type is properly adjusted to produce the best preload condition. Shock loading to the spacer should be avoided as this can change the preload condition and deteriorate the accuracy.

Please fix the mounting screws diagonally. The recommended torque values for medium-hardness steel screws are listed in Table B-30.

Table B-30 Recommended Torque unit: N·m

mounting screw	M2	M2.5	M3	M4	M5	M6	M8
recommended torque	0.4	0.9	1.4	3.2	6.6	11.2	27.6

(for alloy steel screw)

SPR Type

When the flange of SPR type is to be used with a faucet joint (as shown in Figure B-32) the housing bore should be machined to a tolerance of H7 and to a minimum depth of 60% of the flange thickness. If only a light load is applied to the SPR in operation, the flange can be used without a pilot end.

SPB-KP Type

The housing bore for the SPB-KP type should be machined to a tolerance of H7 and keep enough depth (as shown in Figure B-33) so that the outer ring is inside the housing.

SPB Type

The housing bore for the SPB type should be machined to a tolerance of H7 and contain enough depth so that the outer ring is inside the housing. If not, the outer ring may fall off.

Figure B-32 SPR type Mounting Method

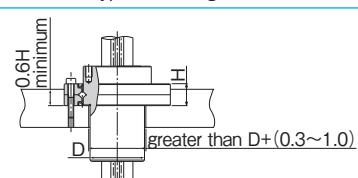

Figure B-33 SPB-KP type Mounting Method

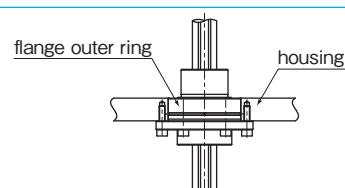

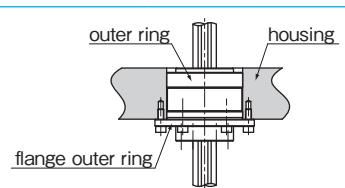

Figure B-34 SPB type Mounting Method

Insertion of Spline Shaft

When inserting the spline shaft into the rotary ball spline nut, ensure that the ball elements do not drop out. This is done by aligning the raceway grooves of the shaft with the rows of ball elements and seal-lip of the nut. Then, carefully insert the spline shaft through the spline nut.

LUBRICATION

Since NB rotary ball spline nuts are equipped with seals at both the spline portion and the rotational portion, the lubricant is retained for an extended period of time. The spline nut is prelubricated with lithium soap based grease prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions.

Low dust generation grease is available from NB standard grease. (refer to page Eng-40) However, an oil lubricant is recommended for high-speed applications. A grease fitting or machining oil holes is optional (Figure B-35-38), please contact NB for details.

SPR Type

A grease fitting for rotational portion and machining oil hole for spline portion are optional.

Figure B-35 Example of Installed Grease Fitting

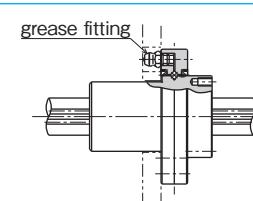

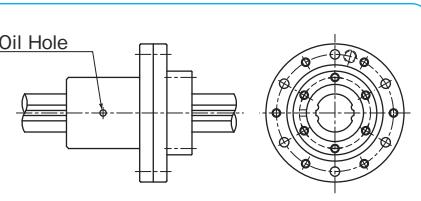

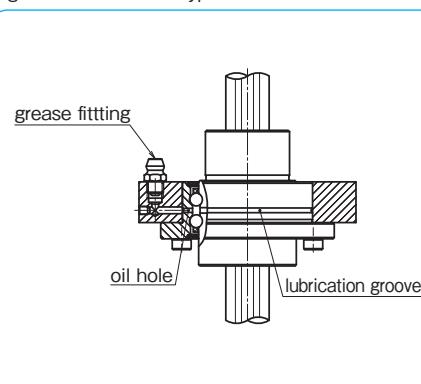

Figure B-36 SPR type Oil Hole

SPB-KP Type

Lubrication is done through oil hole on the outer ring. It is applied the spline portion and the cross roller portion simultaneously.

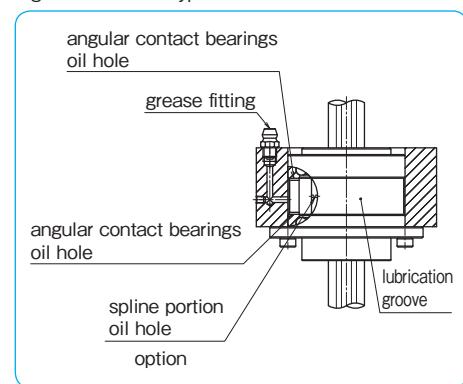

Figure B-37 SPB-KP type Oil Hole

SPB Type

Rotational portion has an oil hole as a standard. For lubrication, it is recommended to mount a grease fitting or oil hole to housing. Machining oil hole for spline portion is available. Please contact NB.

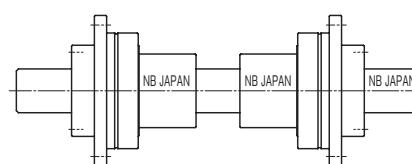

Figure B-38 SPB type Oil Hole

NUT ORIENTATION

Unless otherwise specified, the orientation of two nuts SPR, SPB-KP and SPB type is shown in Figure B-39. In other cases please specify the orientation of nut(s) with shaft.

Figure B-39 Nut Orientation and NB mark

OPERATING CONDITIONS

A Set of Spline Nut and Spline Shaft

The ball spline's accuracy and preload is guaranteed when spline nut and shaft are aligned as shown in Figure B-40. Please make sure to align the NB marks when reinserting the shaft.

At this time, both NB marks on the nut and shaft should be aligned in the same direction as when delivered.

When inserting the spline shaft into the spline nut, ensure that the ball elements do not drop out. This is done by aligning the receway grooves of the shaft with the rows of ball elements and the seal lip of the nut. Then, carefully insert the spline shaft through the spline nut. In case that the nut is preloaded, please exercise additional care. And also, do not disassemble the spline nut.

SPR Type

Please do not loosen the fastening screws for installation flange. The fastening screws are properly adjusted. Please handle with great care, the accuracy is affected if an excessive impact is applied.

SPB Type

Please do not adjust the spacer. The spacer is adjusted to provide a proper spacing for the best preload condition. Please handle with great care, the accuracy is affected if the spacer is slipped by an impact, etc..

Operating Temperature

Resin retainers are used in the rotary ball spline, since the operating temperature should never exceed 80°C.

Dust Prevention

Foreign particles or dust in the rotary ball spline nut affect the motion accuracy and shorten the lifetime. Standard seals will perform well for dust prevention under normal operating conditions; however, in a harsh environment, it is necessary to attach bellows or protective covers.

STROKE BALL SPLINE

The NB stroke ball spline SPLFS type is a highly accurate linear motion bearing with a limited stroke, to which both radial load and torque can be applied at the same time. It operates with extremely low dynamic friction.

STRUCTURE AND ADVANTAGES

The NB stroke ball spline consists of a nut and a shaft both with raceway grooves. The flanged spline nut consists of an outer cylinder, a retainer, side-rings, and ball elements.

Since the retainer in the nut is equipped with ball pockets, the ball elements do not contact each other, which allows for a smooth linear motion. The stroke is limited since the retainer is a non-circulating type. For normal operation, it is recommended to consider 80% of the maximum stroke shown in the dimension table as an actual stroke length.

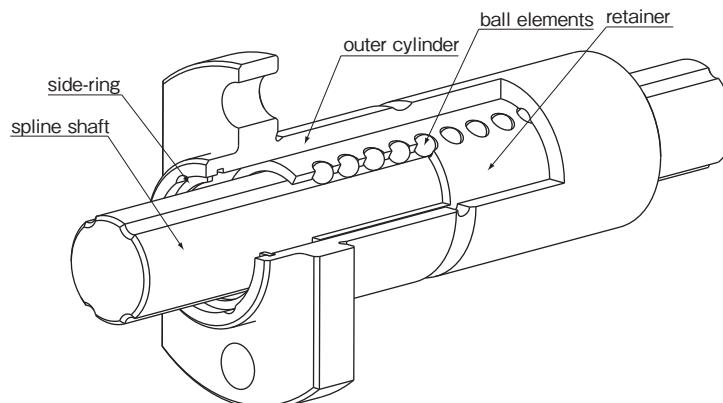

Extremely low Dynamic Friction and Low Noise

The rolling elements are separated by the ball pockets so that they do not contact each other. The stroke length is limited, but extremely low dynamic friction and low noise are realized because the rolling elements do not circulate.

Compact-Size

With the nut about 20% smaller than those of conventional ball splines, it contributes to space saving.

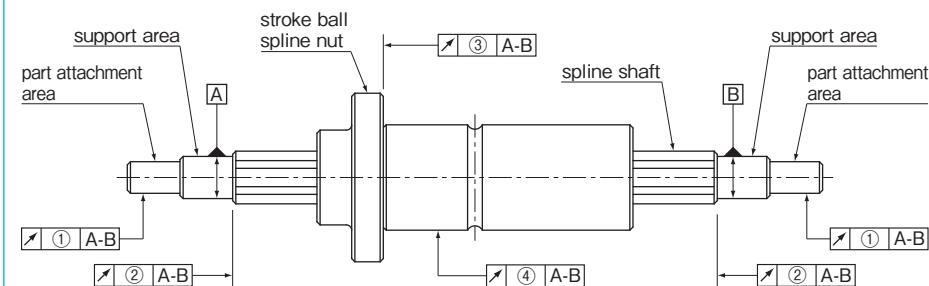

Figure B-41 Structure of SPLFS type

ACCURACY

The accuracy of the NB stroke ball spline is measured at the points shown in Figure B-42.

Figure B-42 Accuracy Measurement Points

Note: The support area is the portion where, for example, radial bearings are attached in order to support the spline shaft.
The part attachment area is the portion to which other parts, such as gears are attached.

Tolerance of Spline Shaft Groove Torsion (Max.)

The groove torsion is indicated per 100mm, arbitrarily set as the effective length of the spline shaft section.

COMPARISON OF DYNAMIC FRICTIONAL RESISTANCE

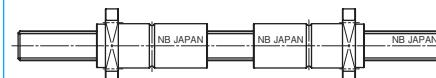

Figure B-43 Comparison of Dynamic Frictional Resistance

NUT ORIENTATION

Unless otherwise specified, the orientation of two nuts NB stroke ball spline is shown in Figure B-44. In other cases please specify the orientation of nut(s) with shaft.

Figure B-44 Nut Orientation and NB mark

USE AND HANDLING PRECAUTIONS

A Set of Spline Nut and Spline Shaft

The ball spline's accuracy and preload is guaranteed when spline nut and shaft are aligned as shown in Figure B-45. Please make sure to align the NB marks when reinserting the shaft.

At this time, both NB marks on the nut and shaft should be aligned in the same direction as when delivered.

When inserting the spline shaft into the spline nut, ensure that the ball elements do not drop out. This is done by aligning the raceway grooves of the shaft with the rows of ball elements and the seal lip of the nut. Then, carefully insert the spline shaft through the spline nut. In case that the nut is preloaded, please exercise additional care. And also, do not disassemble the spline nut.

Dust Prevention

Since the stroke ball spline is designed and manufactured for operation with an extremely low dynamic frictional resistance, seals that increase frictional resistance are not equipped as a standard feature. Please contact NB for a special requirement of seals. For use under harsh conditions, the stroke ball spline should be protected using bellows and protective covers.

Maximum Stroke

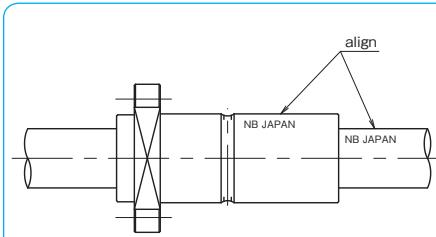

The maximum stroke in the dimension table is the stroke limit.

Retainer Slippage

If the stroke ball spline is used at a high speed or with a vertical shaft, or under an asymmetric load or oscillation, a retainer slippage may occur. For general operation, it is recommended to consider 80% of the maximum stroke length shown in the dimension table as the stroke length.

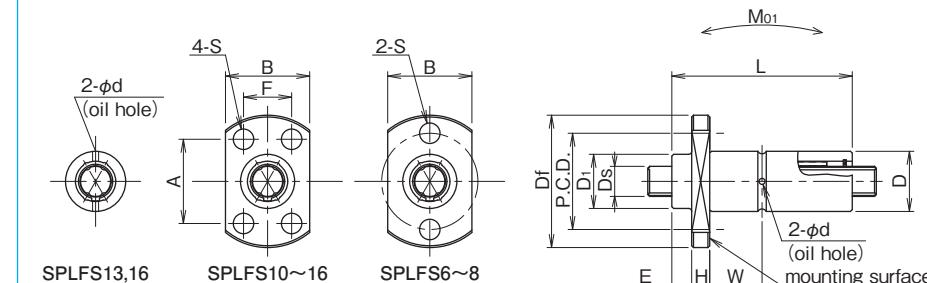

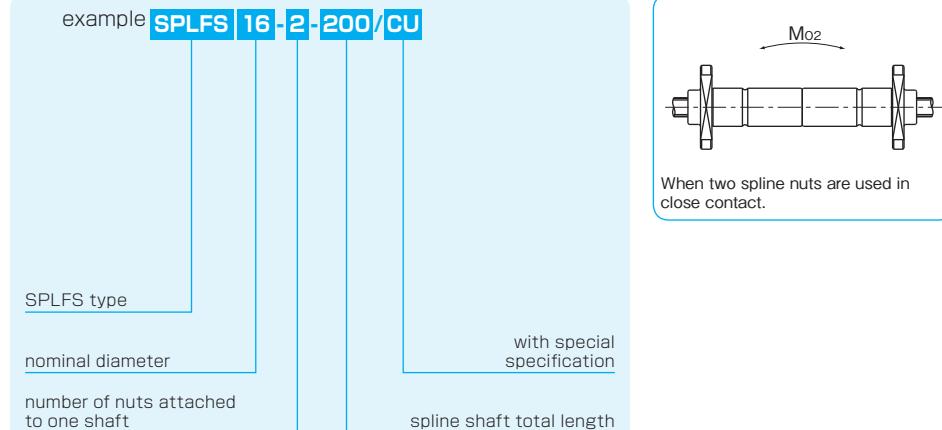

To prevent the retainer slippage, it is recommended to conduct a full-stroke movement of the nut whenever necessary in order for the retainer to be relocated to the center.

BALL SCREW SPLINE

STRUCTURE AND ADVANTAGES

The NB Ball Screw Spline consists of a highly accurate and highly rigid Ball Screw nut and Ball Spline nut attached to the ball screw spline shaft which has a screw groove and spline grooves.

SPBR type has a Rotary Ball Screw nut and Rotary Ball Spline nut.

Rotary Ball Screw nut is an integration of ball screw nut and angular contact bearings.

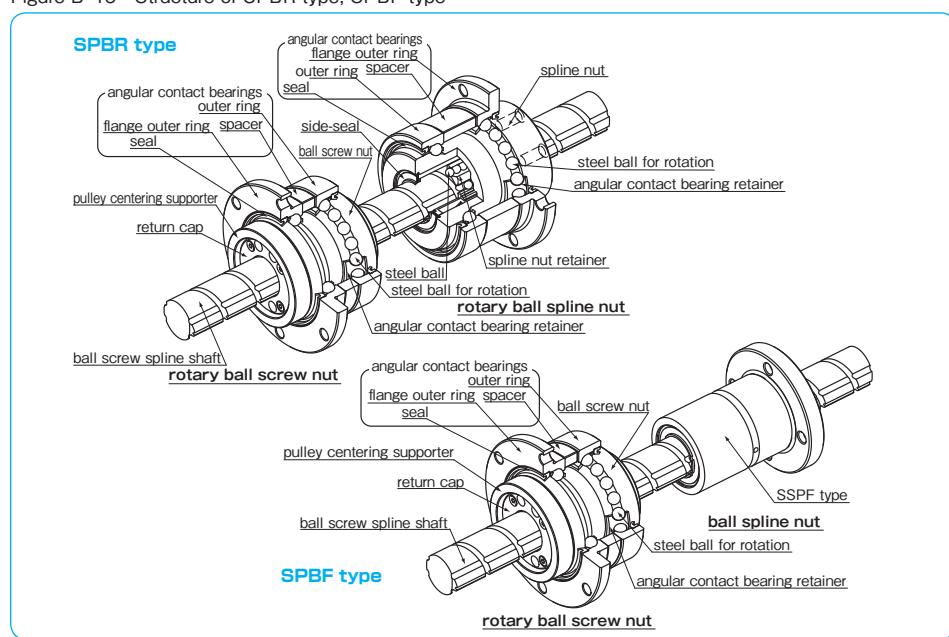

Rotary Ball Spline nut is an integration of ball spline nut and angular contact bearings.

SPBF type has a Rotary Ball Screw nut and a Ball Spline nut.

A single axis of the NB Ball Screw Spline can provide positioning, linear and rotary motion as well as combined spiral motion.

The typical applications are SCARA robot, assembly machine, loader, etc.

Figure B-46 Structure of SPBR type, SPBF type

PRELOAD

The preload is properly adjusted for the ball screw nut, spline nut, and angular contact bearings.

Please contact NB for preload specification.

USE AND HANDLING PRECAUTIONS

● Please do not adjust the spacer. The spacer is adjusted to provide a proper spacing for the best preload condition.

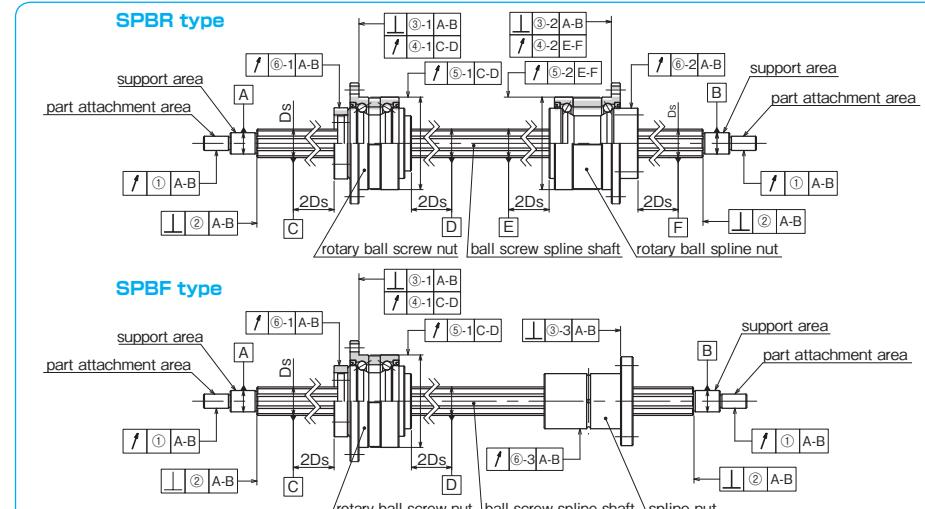

● Please do not remove the Rotary Ball Screw nut from the shaft. There is no ball-retainer in the Rotary Ball Screw nut.

● Please use the pulley centering supporter when attaching the pulley to the return-cap.

ACCURACY

The NB Ball Screw Spline is measured for accuracy at the points shown in Figure B-47.

Figure B-47 Accuracy Measurement Points

Note: The support area is the portion where, for example, radial bearings are attached in order to support the spline shaft. The part attachment area is the portion to which other parts, such as gears, are attached. ④ and ⑤ indicate radial runout during rotational motion.

SLIDE BUSH

The NB slide bush is a linear motion mechanism utilizing the rotational motion of ball elements. Since linear motion is obtained using a simple mechanism, the slide bush can be used in a wide variety of applications, including transportation equipment, food processing equipment, and semiconductor manufacturing equipment.

STRUCTURE AND ADVANTAGES

The outer cylinder of slide bush contains a ball retainer that is perfectly designed to control the circulation of ball elements, resulting in smooth linear motion.

Compact Mechanism

The NB slide bush uses a round shaft for the guiding axis, resulting in space-saving, which allows for compact designs.

A Wide Variety of Shapes and Installation Methods

The NB slide bush is available in various types, standard, clearance-adjustable, open, flange, etc., for a various applications.

Selection According to Environment

NB slide bushes are available in standard and anti-corrosion types. Available options include steel-retainer suitable for use in harsh environments and resin retainer for low acoustic, low-cost requirement. Other options can be specified according to the application requirements.

Compatibility

The NB slide bush is fully compatible with a variety of shaft types.

Doublelip-Seal

Doublelip-seals reduce the grease leakage, keeping the same function as UU seals which prevent the foreign particles from entering the bush. (see page C-11)

outer cylinder	retainer	material	temperature range
		steel	-20°C~110°C
steel	resin	-20°C~ 80°C	
	steel	-20°C~140°C*	
stainless	resin	-20°C~ 80°C	

* If a seal is used in the stainless steel slide bush, the temperature is up to 120°C. Please contact NB if a temperature range exceeds 140°C.

Figure C-3

LIFE CALCULATION

Since ball elements are used as the rolling element in the NB slide bush, the following equation is used to calculate the travel life.

$$L_h = \left(\frac{f_H \cdot f_T \cdot f_C \cdot C}{f_w} \right)^3 \cdot 50$$

L: rated life (km) f_H: hardness coefficient
 f_T: temperature coefficient f_C: contact coefficient
 f_w: applied load coefficient C: basic dynamic load rating (N)
 P: applied load (N)

*Refer to page Eng-5 for the coefficients.

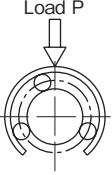

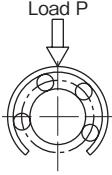

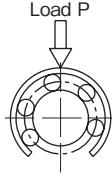

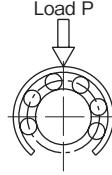

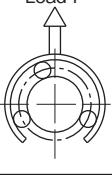

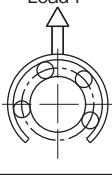

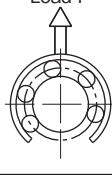

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L_h: life time (hr) l_s: stroke length (m)
 L: rated life (km) n₁: number of cycles per minute (cpm)

LOAD RATING FOR OPEN TYPE SLIDE BUSH

For the open type slide bush an opening is provided to allow the shaft to be supported from underneath. In case a load is constantly applied in the direction of the opening (for example, being used with a vertical shaft or an overhang loading is applied), the load rating decreases due to less number of loaded rows of ball elements (Table C-8). Therefore, the load rating must be calibrated at the time of design based on the direction of the loading.

Table C-8 Direction of Load and Basic Static Load Rating

part number	SM10G~16G-OP KB10G~16G-OP SW 8G~10G-OP SME (D) 10G~16G CE (D) 16 <small>(The loading from below cannot be received by retainer made of stainless steel.)</small>	SM20 (G) -OP KB20 (G) -OP SW12 (G) -OP SME (D) 20 CE (D) 20	SM25 (G) ~100-OP KB25 (G) ~80-OP SW16 (G) ~64-OP SME25~50 SMD25~30 CE (D) 25~30	SM120,150-OP

* Excludes all 3-row steel retainer types. Please contact NB for 3-row steel retainer.

MOUNTING

Examples of Mounting methods are shown in Figures C-4~7.

Figure C-4 Standard Type

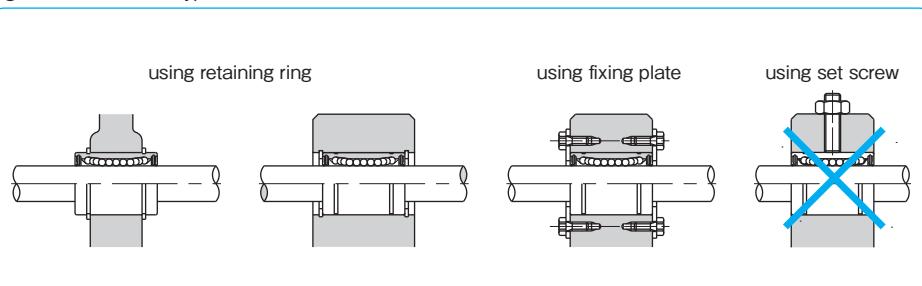

Figure C-5 Clearance Adjustable Type

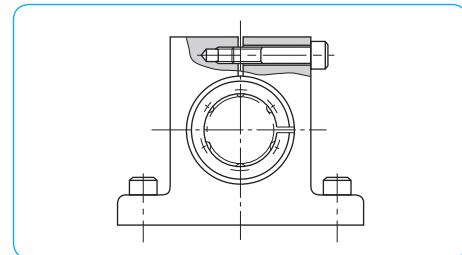

Figure C-6 Open Type

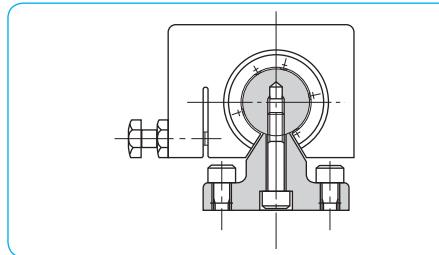

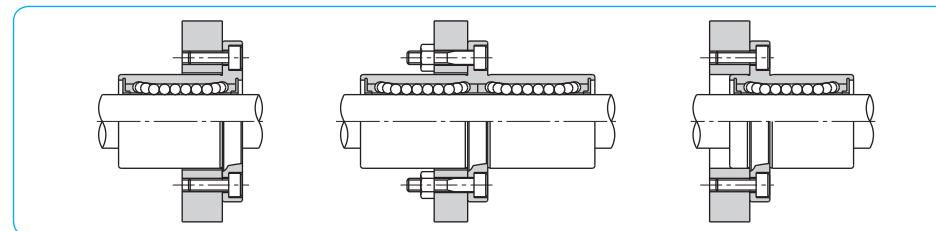

Figure C-7 Flange Type

Fit

The normal clearance fit listed in Table C-9 is generally selected as a shaft outer diameter tolerance for the NB slide bush. The transition fit is selected for a higher accuracy by reducing clearance between slide bush and shaft. Matching bush and shaft (FIT series) is also available for customer's specified clearance. Please be cautious not to apply excess preloading with clearance adjustable and open types. Please keep pre-loading within the maximum radial clearance listed in the dimension table. The flange-type bush is generally inserted into an installation bore, which is slightly larger than the outer cylinder. However, if the outer cylinder is used as the pilot, H7 tolerance is recommended for housing.

The recommended clearances for the flange type are listed in Table C-10.

Table C-9 Recommended Fit

Notes on Shaft Selection:

In order to ensure a high accuracy motion of the bush, it is essential to select a high quality shaft.

In selecting a shaft, please take note of:

Hardness: 58HRC or more (refer to hardness coefficient on page Eng-5) recommended

Surface Roughness: less than Ra0.4 recommended

Retaining Ring for Mounting

It is possible to mount NB slide bush by retaining ring. It is recommended to select the retaining ring with reference to the Table C-11.

Figure C-8 Retaining Ring

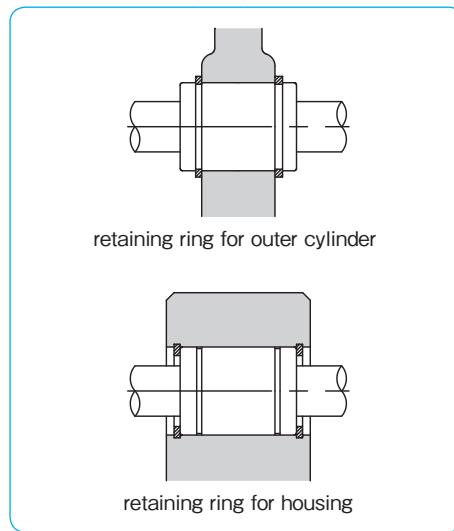

Table C-11 Applicable retaining ring

* part is not in the JIS standard. Please contact NB for details.

LUBRICATION

It is important to lubricate the slide bush for an accurate operation and for a long life. Anti-rust oil is applied to NB slide bush prior to shipment. The NB selected anti-rust oil has a little effect on the lubricant, however, please apply lubricant after cleaning the slide bush by, for example, kerosene, etc.

Grease Lubricant

Prior to usage, please apply grease, then re-lubricate periodically according to the operating conditions. (Lithium soap-based grease is recommended.) Re-lubrication can be done by directly applying grease inside the ball bush or by using a grease fitting as Figure C-9 shows.

A special low dust generating grease is optional for clean room application, please refer to page Eng-40.

Oil Lubricant

Prior to usage, please apply oil directly to the shaft surface or by using an oil hole as Figure C-10 shows. Turbine oil (ISO standard VG32-68) is recommended.

Oil holes can be machined (see Figure C-10) in the center portion of the outer cylinder. Please contact NB for oil hole specification.

Figure C-9 Grease Fitting

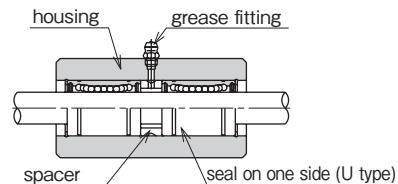

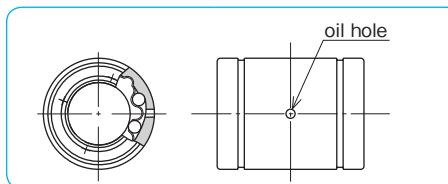

Figure C-10 Oil Hole -Specification-

DUST PREVENTION

Seal

The seals prevent dust from entering the slide bush in order to retain the motion accuracy, resulting in a long life time. The UU type is a standard option that has seals on both sides. The U type has a seal on one side only and is available for the standard, clearance adjustable, and open types. Nitril rubber, which has low wear and good sealing characteristics, is used as the seal material.

* Resin seals are used for GM and GW series.

Doublelip-Seal

A doublelip-seal is a combination of outside lip-seal and inside lip-seal. Outside lip-seal prevents foreign particles from entering the bush and inside lip-seal prevents grease from leaking out of the bush. By the doublelip-seal, the seal resistance shall be increased by some margin. Applicable Part Number: SM(S) 6 to 30, TRF 6 to 30.

Please refer to the dimension table for seal option.

Fluororubber Seal

For a high temperature application, fluororubber seals are available on the SM series size 3 to 30. Please contact NB for details.

Figure C-11 Seal Profile

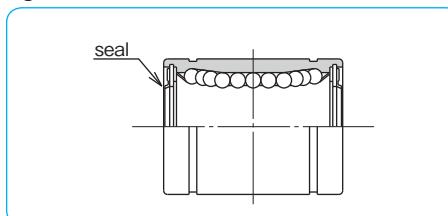

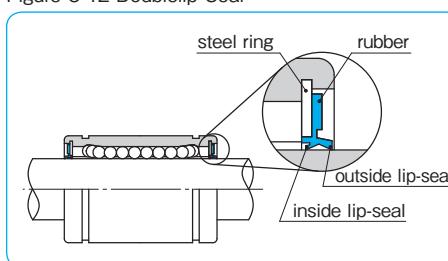

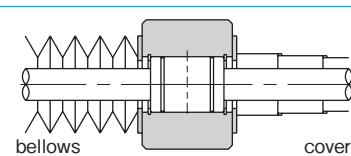

Figure C-12 Doublelip-Seal

COUNTERMEASURE FOR DUST PREVENTION

A smooth ball circulation is hindered by dust or foreign particles inside the slide bush. Seals on both sides is a standard option for the NB slide bush, however, in a harsh environment it is necessary to attach bellows or protective covers.

Figure C-13 Example of Dust Prevention

Felt Seal (Except Flange Type)

If the above dust prevention mechanism is difficult to design, a felt seal is recommended. Due to the oil impregnation effect of the felt, it is possible to extend the lubrication interval and to improve dust resistance.

●Instruction

The felt seal is used by press-fitting into a housing which is manufactured according to the recommended fits in Table C-9.

Stopper of slide bush is necessary other than felt seal.

Insert it between the slide bush and retaining ring as shown in the left figure of Fig. C15, or provide a place to press fit outside the retaining ring as shown in the right figure.

※At the time of shipment, the oil impregnation to the felt seal is not applied.

Figure C-14 Felt Seal

Figure C-15 Example of Felt Seal Installation

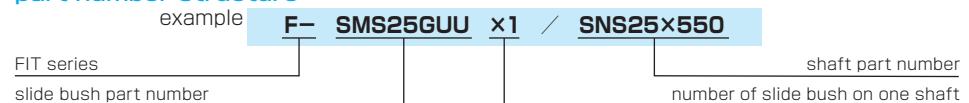

FIT SERIES

Due to the combined tolerances of the bush's bore and the shaft's diameter, accuracy can be affected by clearance or increased dynamic friction caused by preloading.

NB's FIT Series takes advantages of the lower cost slide bush and the precision ground shaft to achieve a target clearance in order for the linear system to produce a smooth, high-accuracy performance.

part number structure

• Please refer to corresponding catalog pages for details.

• Please specify on the drawing about the shaft machining, radial clearance, match-marking, etc.

Recommended Radial Clearance

Depending on the type of application, the clearance range varies, please use the chart below as a guideline.

target	clearance (+)	← 0 →	clearance (-)
light motion			
high accuracy			
no play			

Slide Bush, Radial Clearance (-) , Negative Limit

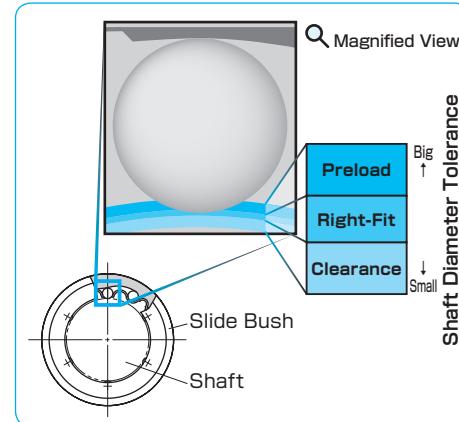

Negative clearance is opted to reduce backlash. Please refer to the chart below for the negative clearance limits.

size	3~8	10~13	16~25	30~35	40	50~60
radial clearance limit	-3μm	-4μm	-6μm	-8μm	-10μm	-13μm

• The off-center of the housing causes uneven loading on the slide bush, please pay special attention to the centering of the housing especially when negative clearance is a requirement.

• Please contact NB for details on the extra preloading requirement or on other part numbers like SRE, SR, etc.

Figure C-16 Radial Clearance between Slide Bush and Shaft

SURFACE TREATMENT AND ANTIRUST EFFECT

In order to adapt various kinds of environment, NB provides flange bushes with surface treatment as a standard.

Table C-13 Surface Treatment

part number	surface treatment	anti-rust effect	color
SK	electroless nickel plating	◎	silver
LF	low temperature black chrome treatment with fluoride coating	◎	black
SB	black oxide (excluding anti-corrosion type)	△	black
SC	industrial chrome plating	○	silver
standard	High-carbon chromium bearing steel (without surface treatment)	-*2	silver
anti-corrosion	Martensite stainless steel (without surface treatment)	○	silver

◎:excellent ○:highly effective ○:effective △:mildly effective

*1 : Please note that tolerance of bushes with surface treatment may be different from the tolerance in dimension table.

Please contact NB for details of thickness of plating.

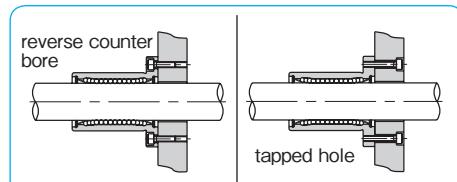

*2 : In order to prevent corrosion, please do not leave de-greased standard bush without surface treatment.

SPECIAL SPECIFICATIONS

● Special Specifications

Please contact NB for more information on surface treatment, oil hole (Figure C-10), flange mounting hole (Figure C-17), etc.

Figure C-17 Examples of Special Installation Hole

ACCURACY OF CE・CD TYPE

The accuracy of CE・CD-type support rails are measured as shown in Figure C-18.

Figure C-18 Accuracy Measurement

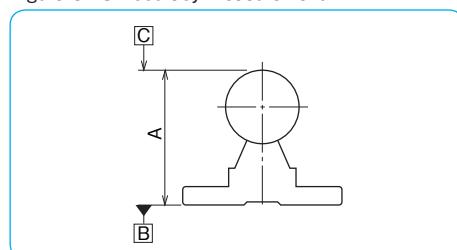

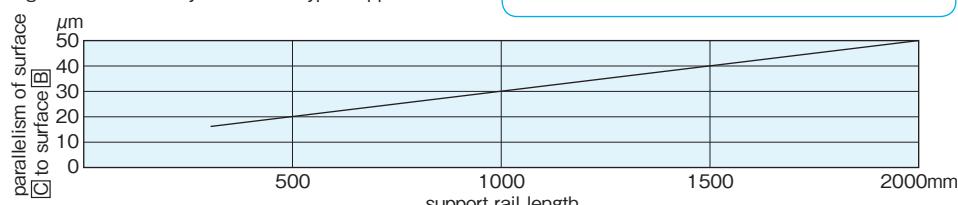

Figure C-19 Accuracy of CE・CD-type Support Rails

USE AND HANDLING PRECAUTIONS

The NB slide bush is a precision component, please handle with care to maintain its high motion accuracy.

The slide bush is designed for linear motion, so that for applications in which a combination of linear and rotational motion is a requirement, let us recommend Stroke Bush, Slide Rotary Bush, or Rotary Ball Spline.

Notes on Installation

When inserting a slide bush into a housing, carefully insert it by using a jig to apply a uniform pushing force at the end of the outer cylinder, as illustrated in Figure C-21. Motion performance may be diminished if an excessive force is applied to the resin portion of the outer cylinder, the side-ring, or the seal.

Ensure that all burrs are removed from the shaft and carefully install the bush by aligning it with the center of the bore. Excessive force may drop out the ball elements during insertion.

When two or more shafts are used, the parallelism of the shafts will greatly affect the motion characteristics and life of the slide bush. Please check the parallelism by moving the slide bush back and forth the length of stroke to check for freedom of movement before final fixing of the shaft. Please refer to page F-3 for shaft specifications.

GM Standard Type

Please avoid a tension load when retaining rings are used for installation.

NOTES ON USAGE OF BLOCK SERIES

Reference Surface

The NB slide units have a reference surface as shown in Figure C-23. Accuracy is achieved by simply pushing the reference surface against the shoulder of the installation surface. (Excluding RBW and SMP types)

Clearance Adjustment

On the clearance adjustment type please avoid excessive preloading. In the same manner please do not apply excessive torque when tightening the screws.

Mounting of RBW Type

RBW type has a resin housing. Table C-14 shows proper torque values.

Recommended Fit

For clearance fit please use a shaft with g6 tolerance and for transition fit a shaft with h6 tolerance. (Excluding adjustable-clearance and open types)

Special Installation Case of SMJ Type

Special mounting holes will be required for installations such as Figure C-24 shows. Please contact NB for special requirements.

TOPBALL®

The NB TOPBALL is a linear motion mechanism utilizing the rotational motion of ball elements. NB's self-aligning TOPBALL can be designed into many different applications such as factory automated equipment, machine tools, industrial machines, electrical equipment, optical and measuring instruments.

STRUCTURE AND ADVANTAGES

Higher Load Capacity and Longer Travel life

NB's uniquely designed load plate provides circular arch contact to the ball element resulting in a greater dispersion of the load, enabling TOPBALL to provide up to three times the load capacity therefore 27 times the travel life of conventional slide bushings.

Self Aligning Capability

Load plates are thinner at the ends to provide a pivot point at the center of the plate. The center acts as a fulcrum to compensate for any slight misalignment between the shaft and the housing bore that might be caused by inaccurate machining, mounting errors or shaft deflection.

Straight load plate ST option is available for non self-alignment.

Floating Seal

NB's unique floating seal design allows for self-alignment while maintaining equal and constant contact to the shaft. Seals do not add to the overall length of the bushing allowing for more compact designs.

Figure D-1 Circular Arch Design and Ground Surface Raceway

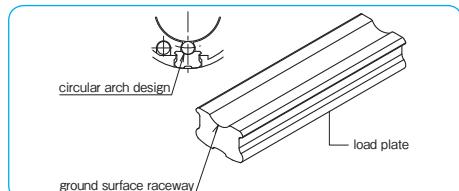

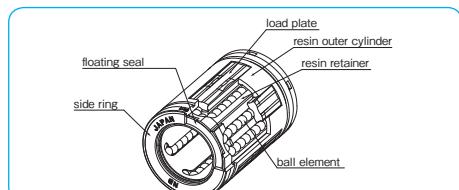

Figure D-3 Basic Structure of TK

High Speed

TOPBALL meets high speed requirements. The maximum speed is 5m/s.

Clearance Adjustable

TOPBALL load plates are designed to "float" in the outer sleeve which allows for clearance between the ball elements and shaft to best suit application requirements.

TOPBALL Unit

This is a TOPBALL with a housing. The housing has the most appropriate bore tolerance that optimizes TOPBALL's performance.

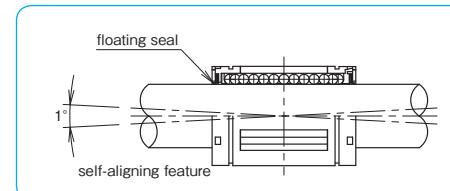

Tolerance interchangeable with Asian Metric Slide Bush Type

Shaft diameter tolerance for TMF and TMA types is the same as Asian Metric slide Bush (refer to "Clearance and Fit" in page D-6).

TMF type is an easy to mount flange type.

Mounting dimensions of TMA type are the same as those of Asian Metric SMA type which makes replacement easy.

Figure D-2 Floating Seal and Self-aligning Feature

Tolerance interchangeable with Asian Metric Slide Bush Type	adjustable-open type	TKD	TKD-W	TWD
		P.D-16	P.D-17	P.D-24
		TMF	TMA	P.D-25
		P.D-18	P.D-19	

LIFE CALCULATION

Since ball elements are used as the rolling element in the NB TOPBALL, the following equation is used to calculate the rated life.

$$L = \frac{(f_H \cdot f_T \cdot f_C \cdot C)^3}{f_W} \cdot 50$$

L: rated life (km) f_H: hardness coefficient
f_T: temperature coefficient f_C: contact coefficient
f_W: applied load coefficient (Table D-2)
C: basic dynamic load rating (N) P: applied load (N)
*Refer to page Eng-5 for the coefficients.

Applied Load Coefficient (f_w)

When calculating the applied load, the weight of the mass, inertial force, moment resulting from the motion, and the variation with time should be accurately estimated. However, it is very difficult to accurately estimate the applied load due to the existence of numerous variables, including the start/stop conditions of the reciprocating motion and of the shock/vibration. Estimation is simplified by using the values given in Table D-2.

RELATION BETWEEN BALL CIRCUITS AND LOAD RATING

The load rating varies according to the loaded position on the circumference. The value in the dimension table indicates the lowest load rating with the load placed on top of one ball circuit. Table D-3 shows the load ratio for the TK and TW TOPBALL.

Table D-3 Load Positions

size	TK8	TK10~TK16	TK20~TK50	TW3~TW8	TW10	TW12~TW32
C (dynamic load rating in the table)						
C _{MAX} (maximum dynamic load rating)						
load ratio C _{MAX} /C C _{MAX} /C	1.414	1.463	1.280	1.414	1.463	1.280
C _Z (dynamic load rating in reverse direction)	none					
load ratio C _Z /C C _Z /C	—	0.44	0.60	0.70	0.44	0.57

If the stroke and number of cycles per unit time are constant, the life time is calculated using the following equation.

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L_h: life time (hr) l_s: stroke length (m)
L: rated life (km) n₁: number of cycles per minute (cpm)

Table D-2 Applied Load Coefficient

operating conditions	applied load coefficient f _w
no shock/vibration 0.25m/s or less	1.0~1.5
low shock/vibration 1m/s or less	1.5~2.0
high shock/vibration 1.5m/s or less	2.0~3.5
high shock/vibration 3m/s or less	3.5~4.0
5m/s or less	4.0 or more

MOUNTING

Clearance and Fit

An appropriate clearance between TOPBALL and shaft is required in TOPBALL operation. Inadequate clearance may cause early failure and/or poor, rough movement. Proper clearance is determined by shaft diameter and housing bore. Table D-4~6 show recommended tolerances of the shaft and housing bore.

Tolerance of TMF and TMA type

Shaft diameter tolerance of TMF and TMA types matches that of Asian Metric Slide Bush:g6.

Table D-6 shows recommended tolerances of TMF and TMA types. Please insert TMF type into an installation bore which is slightly larger than the outer cylinder.

Shaft and Housing

To optimize NB TOPBALL performance, high precision shafts and housings are required.

1. Shaft: Dimensional tolerance, surface roughness and hardness greatly affect the traveling performance of the TOPBALL.

The shaft must be manufactured to the following tolerances.

- A. Surface roughness of Ra0.4 or less.
- B. Hardness of 58 HRC or more (refer to page Eng-5).
- C. The proper tolerance of the shaft diameter is recommended on Table D-4 and D-5.

The NB Shaft is an ideal component manufactured to meet these specifications. Please see pages F-1 ~ for details.

2. Housing: There are a wide range of designs and manufacturing techniques for housings. NB TOPBALL Units are available as standard products. When housings are prepared separately please refer to Table D-4 and D-5 for a proper fit.

Table D-4: Recommended Tolerance for Shaft Dia. and Housing Bore

Mounting

TK type TOPBALL is designed to be press fitted into the housing bore. When inserting bushing, however, don't apply excess force nor shock load which may cause permanent damage. For TW type TOPBALL, examples of mounting are shown in Figures D-4~7 and D-9.

Examples of Mounting

Figures D-4 to D-9 illustrate mounting methods as example.

Figure D-4 Use of Holding Plates

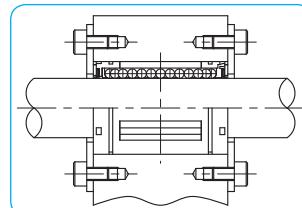

Figure D-5 Clearance Adjustable Type

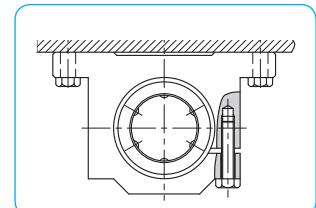

Figure D-6 Use of Retaining Rings

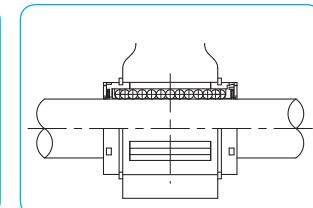

Figure D-7 Open Type

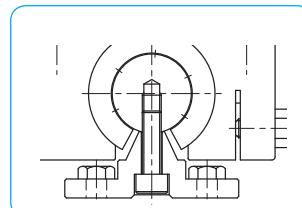

Figure D-8 Press Fit (TK type)

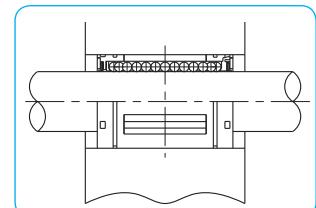

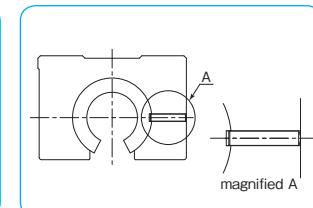

Figure D-9 Pin Fixing

* Please contact NB for SA type support rails' compatibility with the TOPBALL units.

Retaining Ring for Mounting

It is possible to mount NB TOP BALL by retaining ring. It is recommended to select the retaining ring with reference to the Table D-6.

Figure D-10 Retaining Ring

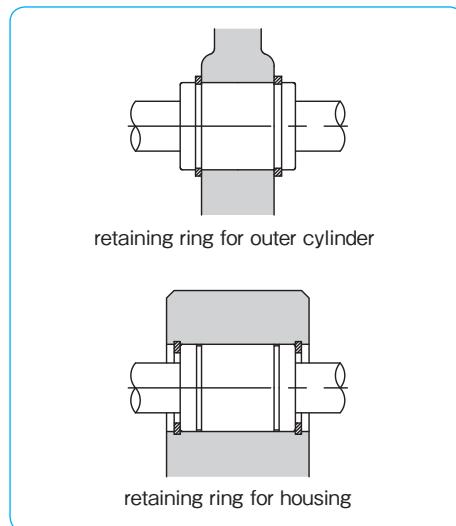

Table D-7 Applicable retaining ring

TK25	40	40
TK30	※ 47	47
TK40	62	62
TK50	75	75

* part is not in the JIS standard. Please contact NB for details.

ANTI-CORROSIVE TYPE

A special TOPBALL is also available for anti-corrosive requirements. Please specify with a suffix "-SK" for either TOPBALL or TOPBALL Unit part number. The load plates are electroless nickel plated and balls are made of stainless steel.

Table D-8

part number	material	
	load plate	ball element
-SK	electroless nickel plate	stainless steel

USE AND HANDLING PRECAUTIONS

Rotational motion not supported

The NB TOPBALL is designed only for linear motion, so that for applications in which a combination of linear and rotational motion is a requirement, Stroke Bush (P. E-2), Slide Rotary Bush (P. E-10), or Rotary Ball Spline (P. B-32) are recommended.

Self Alignment

When used with a single bearing on a single shaft or with a single bearing each on 2 shafts, Self-Alignment causes either shafts or bearings to tilt. To avoid tilting, 2 shafts with 2 bearings on each shaft is recommended. Non-self aligned "ST" type is available only for Euro Metric TK type TOPBALL in size 12 to 40. Please contact NB for details.

Figure D-11

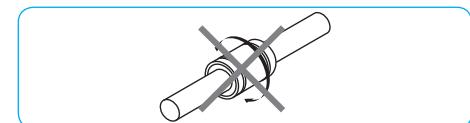

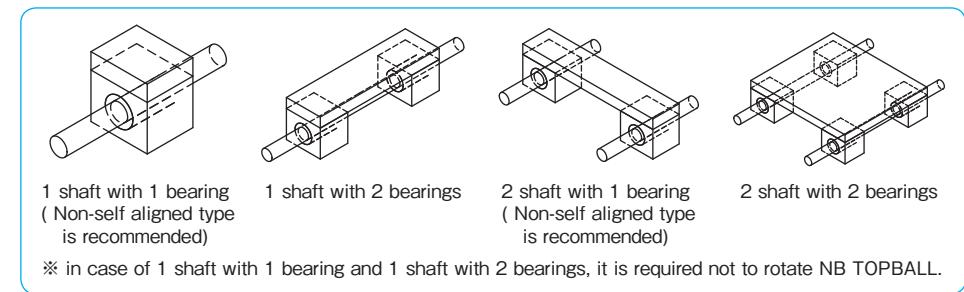

Figure D-12

Operating Temperature Range

The operating temperature range is from -20°C to 80 °C . In case of operation at a temperature outside of this range, please contact NB.

Dust Prevention

Foreign particles and dust in the NB TOPBALL affect the motion accuracy and shorten product life. Standard seals will perform well for dust prevention under normal operating conditions, however, in harsh environment it may be necessary to attach protective covers.

Lubrication

It is important to lubricate the NB TOPBALL for an accurate operation and for a long life. Anti-rust oil is applied to the NB TOPBALL prior to shipment only. The NB selected anti-rust oil has a little to no effect on lubricants, however, please apply lubricant after cleaning the TOPBALL, for example, using kerosene, etc. For grease lubrication, lithium soap-based grease is recommended. A special low dust generating grease is also available for clean room application. Please refer to page Eng-40 for details.

Operating Speed

The maximum speed is 5m/s. Product life time may be shortened if operating speed is more than 3m/s due to wear of resin components. Please set applied load coefficient and static safety factor with a margin.

DIMENSION TABLE	E-27

STROKE BUSH

The NB stroke bush is a linear and rotational motion mechanism utilizing the rotational motion of ball elements between an outer cylinder and a shaft. It is compact and can withstand high loading.

The retainer is made of a light metal alloy with high wear resistance. Smooth motion is achieved under high-speed and high-acceleration conditions.

Although the linear motion is limited to a specific stroke length, the combined rotation and stroke motion is achieved with very little frictional resistance. The NB stroke bush can be conveniently used in a variety of applications.

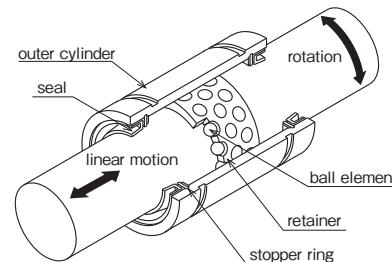

STRUCTURE AND ADVANTAGES

The retainer in the NB stroke bush positions the ball elements in a zigzag arrangement. The inner surface of the outer cylinder is finished by precision grinding, resulting in smooth motion of the ball elements. Each of the ball elements is held in a separate hole and smooth motion is achieved for both rotational motion and linear motion. The retainer moves half the length of the linear motion; therefore, the stroke length is limited to approximately twice the length the retainer can travel within the outer cylinder.

High Precision

High-carbon chromium bearing steel is used for the outer cylinder. It is heat treated and ground to achieve high rigidity and accuracy.

Figure E-1 Structure of SR Stroke Bush

TYPE

Table E-1 Type

	Standard Type	Double Retainer Type
SR TYPE		
	P.E-6	P.E-8

ALLOWABLE SPEED FOR COMBINED ROTATION AND STROKE MOTION

The allowable speed for combined rotation and stroke motion is obtained from the following equation:

The value of DN is given as follows depending on the lubrication method.

$$DN \geq dm \cdot n + 10 \cdot S \cdot n_1$$

for oil lubrication	DN=600,000
for grease lubrication	DN=300,000
note.....n≤5,000 S·n ₁ ≤50,000	

RATED LOAD AND RATED LIFE

The relationship between the rated load and life of the stroke bush is expressed as follows:

$$L = \frac{(f_H \cdot f_T \cdot f_C \cdot C)^3}{f_W} \times 10^6$$

L: rated life f_H: hardness coefficient

f_T: temperature coefficient f_C: contact coefficient

f_W: applied load coefficient

C: basic dynamic load rating (N)

P: applied load (N)

※Refer to page Eng-5 for the coefficients.

$$L_h = \frac{L}{60\sqrt{(dm \cdot n)^2 + (10 \cdot S \cdot n_1)^2} / dm}$$

●For stroke motion

$$L_h = \frac{L}{600 \cdot S \cdot n_1 / (\pi \cdot dm)}$$

L_h: life time (hr) S: stroke length (mm)

n: revolutions per min. (rpm)

n₁: number of cycles per minute (cpm)

dm: ball pitch diameter (mm) ≈ 1.15 dr

FIT

The fits generally used between the shaft and the housing are listed in Table E-2. The inner contact diameters of the SR stroke bush are listed in the dimension tables. The shaft diameter tolerance should be selected to achieve the desired amount of radial clearance (see Table E-3). Please pay attention that high-speed linear motion can cause the retainer to slip due to inertial force.

In selecting a shaft, please take note of:
Hardness: 58HRC or more (refer to hardness coefficient on page Eng-5) recommended
Surface Roughness: less than Ra0.4 recommended

MOUNTING

Examples of mounting methods of Stroke Bush are shown in Figure E-2. To avoid deformation, do not fix outer cylinder by using set screw.

Figure E-2 Mounting Method

LUBRICATION

Appropriate lubrication is needed to ensure the accuracy of NB Stroke Bush and to maintain bearing life. Anti-rust oil is applied to NB Stroke Bush prior to shipment. The NB selected anti-rust oil has a little to no effect on lubricants, however, please apply lubricant only after cleaning Stroke Bush with kerosene, etc.

Grease Lubricant

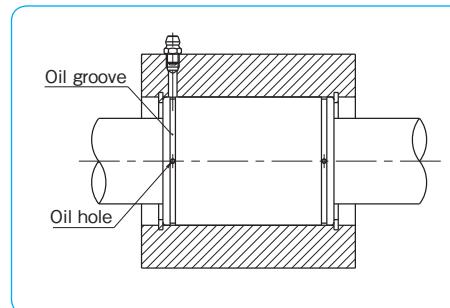

Prior to usage, please apply grease, and re-lubricate periodically according to the operating conditions. (Lithium soap-based grease is recommended.) Relubrication can be done by directly applying grease inside the ball bush or by using oil hole as Figure E-3 shows.

A special low dust generation grease is optional for clean room application. Please refer to page Eng-40.

Oil Lubricant

Prior to usage, please apply oil directly to the shaft surface or by using oil hole as Figure E-3 shows. Turbine oil (ISO standard VG32-68) is recommended.

Figure E-3 Oil hole

USE AND HANDLING PRECAUTIONS

Maximum Stroke

The maximum stroke in the dimension table is the stroke limit.

Retainer Slippage

The retainer can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is suggested that the stroke to be set as a 80% of the maximum stroke in the dimension table. It is also recommended that the bush be cycled to perform the maximum stroke several times, so that the retainer returns to its central position.

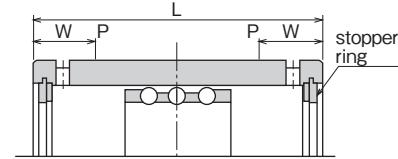

Accuracy

The accuracies of the SR stroke bush are stated in the dimension tables. Since the outer cylinder deforms due to tension from the retaining ring, the dimension of the outer cylinder is an average value at points P, where calculated using the following equation:

$$W=4+L/8$$

W: the distance from the end of the outer cylinder to measurement point P
L: the length of the outer cylinder

Figure E-4 Outer Cylinder Measurement Points

Operating Temperature Range

The operating temperature is ranging from -20 °C to 110°C. In case of operation at temperature outside this range, please contact NB.

Dust Prevention

Dust and other contaminations affect the bush's lifetime and accuracy if dust or particle enter into inside of bush. Although seals work under a normal environment, in a harsh environment, it is necessary to attach protective covers.

SLIDE ROTARY BUSH SRE SERIES

The NB Slide Rotary Bush SRE Series provides rotary and linear motion functions. Linear motion with unlimited stroke and rotary motion are merged into a single bush resulting in great space saving compared with a combination of any conventional bearings. There are three types; standard, flange, and unit type with sizes ranging from 6 to 40.

STRUCTURE AND ADVANTAGES

NB Slide Rotary Bush features a special retainer fitted into cylindrical steel outer cylinder and is designed to guide steel balls for smooth circulation in its retainer. The retainer is also designed to rotate freely towards radial direction and offers smooth linear and rotary motions.

Smooth Operation

The inner surface of the outer cylinder allows smooth operation of linear and rotary motions while maintaining a uniform load distribution.

High Load Capacity

The use of comparatively large diameter steel balls enhances the load capacity.

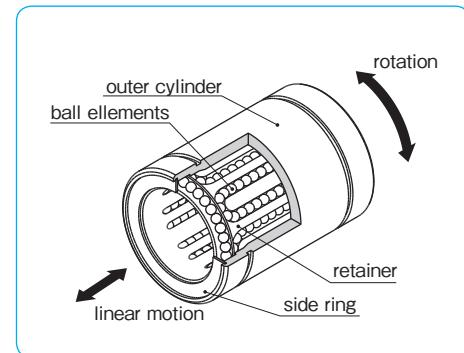

Smooth Rotation

The positioning of the steel balls in a cylindrical formation inside the retainer enables a smooth rotational motion regardless of the installation direction.

Complete Interchangeability

NB Slide Rotary series is completely interchangeable with SM type Slide Bush, SMK type Flanged Slide Bush and SMA(W) type, AK(W) type and SMP type.

RATED LOAD AND RATED LIFE

The rated life and load rating are defined as follows.

Rated Life

When a group of slide rotary bearings of the same type are used under the same conditions, the rated life is defined as the total number of rotations made without causing flaking by 90% of the bearings.

Basic Dynamic Load Rating

The basic dynamic load rating is defined as the load with a constant magnitude and direction at which a rated life of 10^6 rotations can be achieved.

Basic Static Load Rating

The basic static load rating is defined as the load with a constant direction that would result in a certain contact stress at the mid-point of the rolling element and tracking surface that are experiencing the maximum stress.

Equation (1) gives the relation between the applied load and the rated life of the slide rotary bush.

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P} \right)^3 \times 10^6 \quad \dots \dots \dots (1)$$

L: rated life (rotations) f_H: hardness coefficient
f_T: temperature coefficient f_C: contact coefficient
f_w: applied load coefficient C: basic dynamic load rating (N)
P: applied load (N)

※Refer to page Eng-5 for the coefficients.

Since the slide rotary bush is used in applications with combined linear and rotary motions, the life time is obtained using Equations (2) and (3).

● When linear and rotary motions are combined

$$L_h = \frac{L}{60\sqrt{(dm \cdot n)^2 + (10 \cdot S \cdot n_1)^2}/dm} \quad \dots \dots \dots (2)$$

● When only linear motion is involved

$$L_h = \frac{L}{600 \cdot S \cdot n_1 / (\pi \cdot dm)} \quad \dots \dots \dots (3)$$

L_h: life time (hr) S: stroke length (mm) n: revolutions per minute (rpm) n₁: number of cycles per minute (cpm)
dm: ball pitch diameter (mm) ≈ 1.15dr (dr is the inner contact diameter of the SRE series)

Calculation Example

The life of SRE20 type NB slide rotary bush is calculated based on the following conditions.

● Conditions

Motion: Linear and rotational combined Load: P=30N Stroke: S=200mm

Revolutions per minute: n=15rpm Number of cycles per minute: n₁=10cpm

Shaft surface hardness: greater than 58 HRC

Operating temperature: room temperature Other: single shaft with single bush

● Calculation

Basic dynamic load rating: C=647 N

Based on the above conditions, the life is calculated using the following coefficient values.

Hardness coefficient f_H=1, Temperature coefficient f_T=1, Contact coefficient f_C=1

Applied load coefficient, f_w=1.5

Rated life

$$\begin{aligned} L &= \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P} \right)^3 \times 10^6 \\ &= \left(\frac{1 \times 1 \times 1}{1.5} \cdot \frac{647}{30} \right)^3 = 2,972 \times 10^6 \text{ (rotations)} \end{aligned}$$

Life (in hours)

$$\begin{aligned} L_h &= \frac{L}{60\sqrt{(dm \cdot n)^2 + (10 \cdot S \cdot n_1)^2}/dm} \\ &= \frac{2,972 \times 10^6}{60\sqrt{(1.15 \times 20 \times 15)^2 + (10 \times 200 \times 10)^2}/(1.15 \times 20)} \\ &= 56,900 \text{ (h)} \end{aligned}$$

FIT

Shaft

In order to ensure high accuracy motion of Slide Rotary Bush SRE type, it is essential to select a high quality shaft. In selecting a shaft, please take note of:

Outer diameter tolerance: g6 recommended

Surface hardness: 58HRC or higher

For a shaft with surface hardness less than 58HRC, make a correction in life calculation by adding hardness coefficient.

Surface roughness: lower than Ra0.4 or better

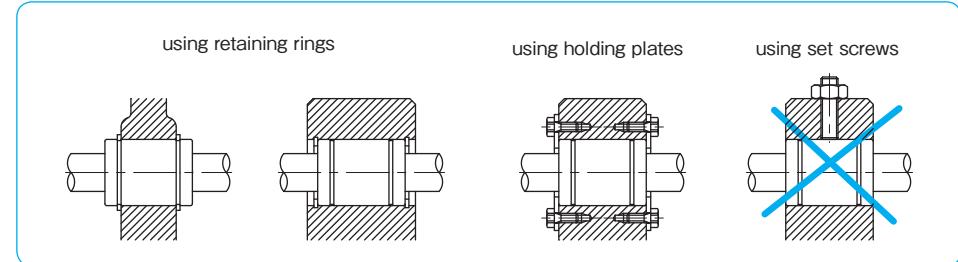

Housing

Inner diameter tolerance: H7 recommended

MOUNTING

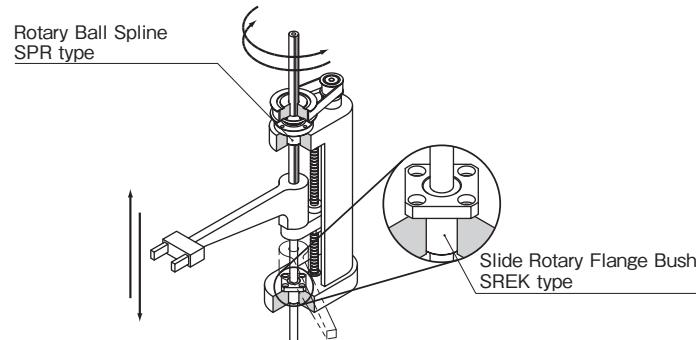

Examples of mounting methods are shown in Figure E-6. Please do not fix outer cylinder by using set screw to avoid deformation.

Figure E-6 Mounting Method

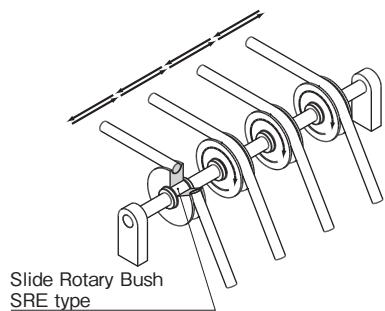

APPLICATION EXAMPLES

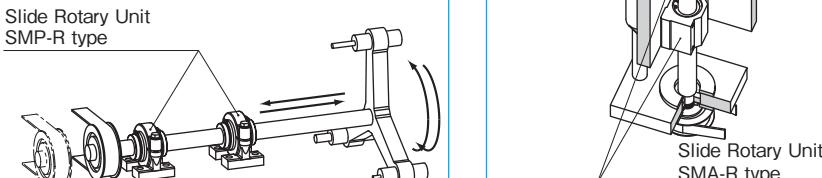

Application Example 1 Vertical Shaft Robot Arm

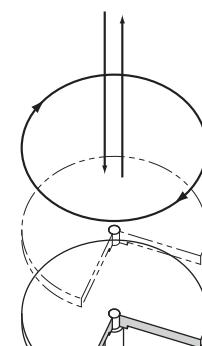

Application Example 2 Multiple Gearing Idler

Application Example 3 Tool Changer

Application Example 4 Turntable

USE AND HANDLING PRECAUTIONS

Lubrication

Lubrication is needed (1) to prevent heat fusing by reducing friction between the rolling elements and the tracking surface, (2) to reduce wear of the structural elements, and (3) to prevent rusting. Lubrication affects both the performance and life of the bush. A lubrication method and a lubrication agent appropriate to the operating conditions should be selected. For oil lubrication, turbine oil (ISO standard VG32-68) is recommended. For grease lubrication, lithium soap based grease No. 2 is recommended. The replenishment interval depends on the operating conditions.

Dust Prevention

Dust and other contaminants affect the bush's lifetime and accuracy. Appropriate prevention methods are thus important.

Operating Temperature Range

The operating temperature is ranging from -20°C to 110°C . In case of operation at a temperature outside this range, please contact NB.

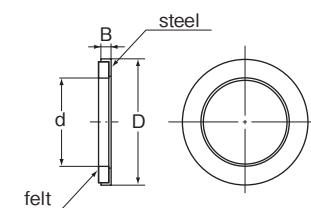

Retainer Material

The standard material of SRE Retainer is stainless steel. When requiring other material, please contact NB.

FELT SEAL

A felt seal FLM strengthens lubrication characteristics and extends relubrication period of the slide rotary bush. At the time of shipment, the oil impregnation to the felt seal is not applied.

Figure E-7 Felt Seal

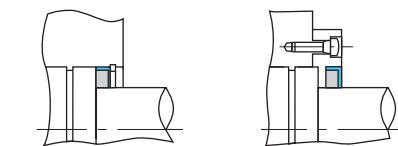

Installation

The felt seal does not work as a retaining ring. Figure E-8 shows how to install the felt seal.

SLIDE ROTARY BUSH RK TYPE

NB's RK type slide rotary bush is a highly accurate and high load capacity bearing providing smooth continuous linear and rotational motions. Its structure imposes no constraints on linear and rotational motions. It is much more compact than a standard slide bush with separate rotational bearing.

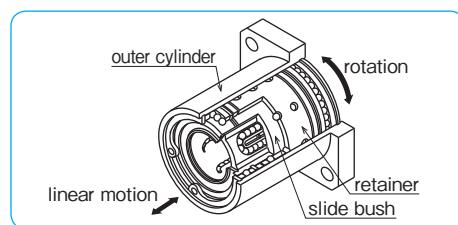

STRUCTURE AND ADVANTAGES

The RK type slide rotary bush uses a retainer similar to that used in the SR type stroke bush. This retainer gives a smooth motion in a high rotational application.

SM type slide bush is incorporated, providing the stable and smooth linear motion.

Relatively large ball elements are used for high load capacity.

Figure E-9 Structure of RK Slide Rotary Bush

FIT

Shaft

In order to ensure high accuracy motion of Slide Rotary Bush RK type, it is essential to select a high quality shaft. In selecting a shaft, please take note of:

Outer diameter tolerance: h5 recommended

Surface hardness: 58HRC or higher

For a shaft with surface hardness less than 58HRC, make a correction in life calculation by adding hardness coefficient.

Surface roughness: lower than Ra0.4 or better

LIFE CALCULATION

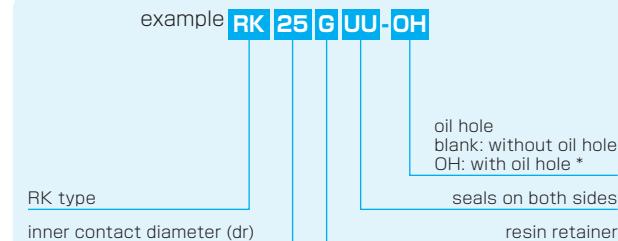

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P} \right)^3 \times 50$$

L: rated life (km) f_H: hardness coefficient
 f_T: temperature coefficient f_C: contact coefficient
 f_w: applied load coefficient
 C: basic dynamic load rating (N) P: applied load (N)
 *Refer to page Eng-5 for the coefficients.

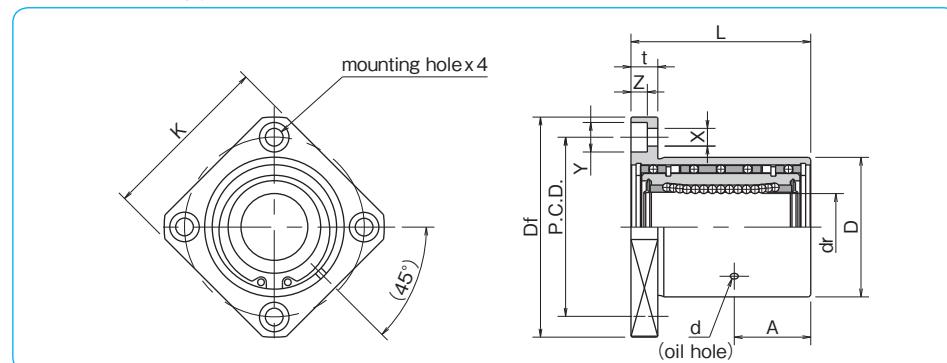

RK TYPE

part number structure

SHAFT

SHAFT

The NB shaft can be used in a wide range of applications as a mechanical component from straight shaft to spindle shaft. NB's expertise in machining and heat-treatment turns into manufacturing spindle shaft, roll shaft, and general machinery shaft for rotational motion. NB's high accuracy technology answers various shaft machining requirements.

ADVANTAGES

Advanced Machining Technology

NB performs a wide variety of highly accurate machining processes to provide custom shafting from relatively simple machining, such as tapping and shaft stepping to the more demanding high-speed rotating shafts and spindles. NB can also answer the special grinding and bore machining requirements.

Excellent Wear Resistance

Most commonly used materials are high-carbon chromium bearing steel (SUJ2) and martensite stainless steel (SUS440C or equivalent). NB's advanced heat-treatment technology gives these materials an excellent wear resistance by quenching and tempering to achieve a uniform hardened layer in the circumferential and axial directions. The cross-sectional picture below shows the hardened layer-depth of the NB shaft.

Hardened Layer
(cross section)

Surface Roughness

Precision grinding results in a surface roughness of less than Ra0.4.

Wide Selection of Shaft Types

SN type, SNS type, SNT type,
SNB, SNSB type (Center-lined tapped shaft)
Spindle shaft, roll shaft

Special Requirements

Based on the customer drawings and specifications
NB will answer the customer requirements in
material (SCM, SKS etc.), heat-treatment, surface
treatment, etc.

Shaft Supporter and Shaft Support Rail

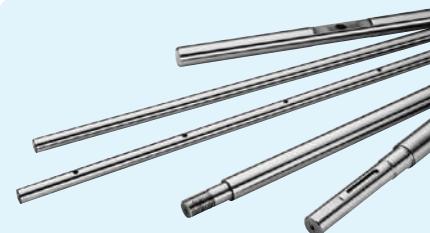

These components ease the shaft installation and
help save the design/assembling time. (refer to page
F-10)

FIT Series

This series is a set of NB slide bush and NB shaft.
By precise shaft-grinding, FIT series achieves the
best-fit clearance adjustment for a smooth, high
accuracy linear motion. (refer to page F-33)

CALCULATION OF DEFLECTION AND DEFLECTION ANGLE

The following formulas are used to obtain the deflection and its angle of the shaft. Typical conditions are listed in Table F-3.

Table F-3 Formulas for Calculating Deflection and Deflection Angle

support method	specification	formula for deflection	formula for deflection angle
1 support 1 support		$\delta_{\max} = \frac{P\ell^3}{48EI} = P\ell^3C$ $i_1 = 0$ $i_2 = \frac{P\ell^2}{16EI} = 3P\ell^2C$	
2 fixed 1 fixed		$\delta_{\max} = \frac{P\ell^3}{192EI} = \frac{1}{4}P\ell^3C$ $i_1 = 0$ $i_2 = 0$	
3 support 1 support		$\delta_{\max} = \frac{5p\ell^4}{384EI} = \frac{5}{8}p\ell^4C$ $i_2 = \frac{p\ell^3}{24EI} = 2p\ell^3C$	
4 fixed 1 fixed		$\delta_{\max} = \frac{p\ell^4}{384EI} = \frac{1}{8}p\ell^4C$ $i_2 = 0$	
5 support 1 support		$\delta_1 = \frac{Pa^3}{6EI} \left(2 + \frac{3b}{a}\right) = 8Pa^3 \left(2 + \frac{3b}{a}\right)C$ $\delta_{\max} = \frac{Pa^3}{24EI} \left(\frac{3\ell^2}{a^2} - 4\right) = 2Pa^3 \left(\frac{3\ell^2}{a^2} - 4\right)C$ $i_1 = \frac{Pab}{2EI} = 24PabC$ $i_2 = \frac{Pa(a+b)}{2EI} = 24Pa(a+b)C$	
6 fixed 1 fixed		$\delta_1 = \frac{Pa^3}{6EI} \left(2 - \frac{3a}{\ell}\right) = 8Pa^3 \left(2 - \frac{3a}{\ell}\right)C$ $\delta_{\max} = \frac{Pa^3}{24EI} \left(2 + \frac{3b}{a}\right) = 2Pa^3 \left(2 + \frac{3b}{a}\right)C$ $i_1 = \frac{Pa^2b}{2EI\ell} = \frac{24Pa^2bC}{\ell}$ $i_2 = 0$	
7 fixed 1 free		$\delta_{\max} = \frac{P\ell^3}{3EI} = 16P\ell^3C$ $i_1 = \frac{P\ell^2}{2EI} = 24P\ell^2C$ $i_2 = 0$	
8 fixed 1 free		$\delta_{\max} = \frac{p\ell^4}{8EI} = 6p\ell^4C$ $i_1 = \frac{p\ell^3}{6EI} = 8p\ell^3C$ $i_2 = 0$	
9 support 1 support		$\delta_{\max} = \frac{\sqrt{3}Mo\ell^2}{216EI} = \frac{2\sqrt{3}}{9}Mo\ell^2C$ $i_1 = \frac{Mo\ell}{12EI} = 4Mo\ell C$ $i_2 = \frac{Mo\ell}{24EI} = 2Mo\ell C$	
10 fixed 1 fixed		$\delta_{\max} = \frac{Mo\ell^2}{216EI} = \frac{2}{9}Mo\ell^2C$ $i_1 = \frac{Mo\ell}{16EI} = 3Mo\ell C$ $i_2 = 0$	

δ_1 : deflection at the concentrated load point (mm) δ_{\max} : maximum deflection (mm) i_1 : deflection angle at the concentrated load point (rad)
 i_2 : deflection angle at the support point (rad) Mo : moment (N · mm) P : concentrated load (N)
 p : uniformly distributed load (N/mm) a, b : concentrated load point distance (mm) ℓ : span (mm) I : moment of inertia of area (mm⁴)
 E : modulus of longitudinal elasticity (SUJ2) 2.06×10^5 (N/mm²) (SUS) 2.0×10^5 (N/mm²) C : $1/48EI$ (1/N · mm²)

The moment of inertia of area (I) is obtained using the following formulas:

● For solid shaft

$$I = \frac{\pi D^4}{64}$$

● For hollow shaft

$$I = \frac{\pi}{64} (D^4 - d^4)$$

I : moment of inertia of area (mm⁴)
 D : outer diameter (mm) d : inner diameter (mm)

The values of the moment of inertia of area and C ($=1/48 EI$) for NB shafts are listed in Table F-4 and F-5.

Calculation Examples

1. Calculating the maximum deflection of a 30mm shaft with a 500mm span when a concentrated load of 980 N is applied at the mid-point of the shaft ... (neglecting the shaft weight)

① In case the support method is support-support:

From the given conditions, $P = 980$ N, $\ell = 500$ mm
 From Table F-4, C for an outer diameter of 30 mm,
 $C = 2.54 \times 10^{-12}$ (N · mm²).

Substituting these values into the corresponding formula (No. 1) in Table F-3,
 $\delta_{\max} = P\ell^3C = 0.31$ (mm)

② In case the support method is fixed-fixed:

Substituting the values into the corresponding formula (No. 2) given in Table F-3,

$$\delta_{\max} = \frac{1}{4}P\ell^3C = 0.08 \text{ (mm)}$$

2. Calculating the maximum deflection of a 60mm shaft with an inner diameter of 32 mm and a 2,000 mm span by its own weight ...

From Table F-5, C for an outer diameter of 60 mm,
 $C = 1.73 \times 10^{-13}$ (N · mm²)

The mass per unit length of a shaft with an outer diameter of 60 mm and an inner diameter of 32 mm is 15.9kg/m. Therefore, a uniformly distributed load of 0.156 N/mm is applied. Substituting these values into the formula (No. 3) given in Table F-3.

$$\delta_{\max} = \frac{5}{8}p\ell^4C = 0.27 \text{ (mm)}$$

NB CENTER-LINED TAPPED SHAFT

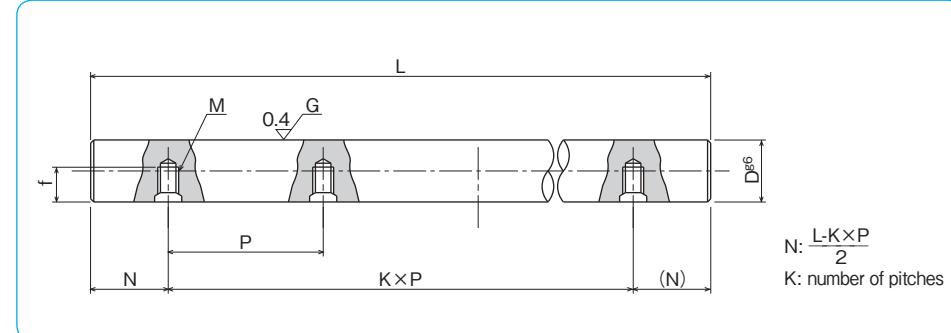

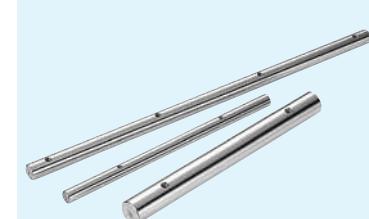

A larger diameter shaft can overcome problems in maintaining precision functionality when a high or unbalanced load is applied. A combination of the center-lined tapped shaft together with the SA type support rail is ideal in such cases. (see pages F-18,19) The center-lined tapped shaft is standardized to simplify shaft selection.

All sizes are also available without pre-drilled mounting holes.

Complete shaft-rail assemblies are also available as well as custom drilling and lengths.

Please send drawings with customer specifications.

FIT SERIES

Due to the combined tolerances of the bush's bore and the shaft's diameter, accuracy can be affected by clearance or increased dynamic friction caused by preloading.

NB's FIT Series takes advantages of the lower cost slide bush and the precision ground shaft to achieve a target clearance in order for the linear system to produce a smooth, high-accuracy performance.

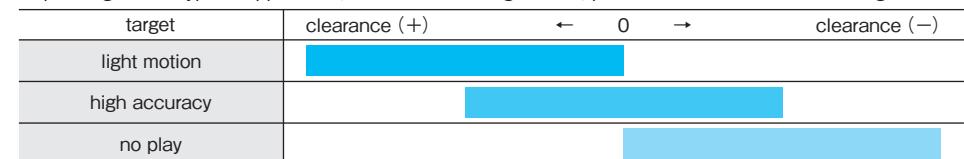

part number structure

- Please refer to corresponding catalog pages for details.
- Please specify on the drawing about the shaft machining, radial clearance, match-marking, etc.

Recommended Radial Clearance

Depending on the type of application, the clearance range varies, please use the chart below as a guideline.

Slide Bush, Radial Clearance (-), Negative Limit

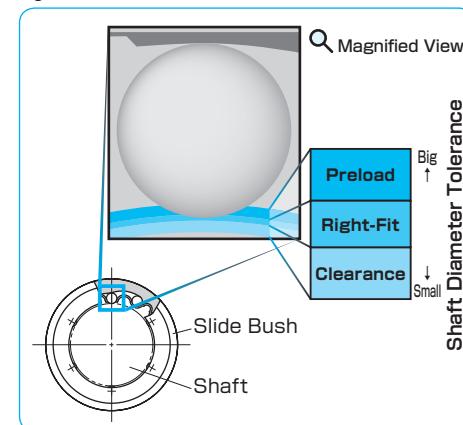

Negative clearance is opted to reduce backlash. Please refer to the chart below for the negative clearance limits.

size	3~8	10~13	16~25	30~35	40	50~60
radial clearance limit	-3 μm	-4 μm	-6 μm	-8 μm	-10 μm	-13 μm

- The off-center of the housing causes uneven loading on the slide bush, please pay special attention to the centering of the housing especially when negative clearance is a requirement.

- Please contact NB for details on the extra preloading requirement or on other part numbers like SRE, SR, etc.

Figure F-3 Radial Clearance between Slide Bush and Shaft

SPINDLE SHAFT

NB Spindle Shaft is backed by decades of precision manufacturing experience as well as up to date manufacturing facility to meet demands. NB is capable of handling all your spindle needs such as manufacturing of bearing case and spindle base, design and manufacturing of spindle unit, and overhauling of spindles.

ADVANTAGES

Ultra Precision Machining

Spindle manufacturing facility is controlled to a constant temperature throughout the year for precision manufacturing of spindles.

Various Machining Solution Available

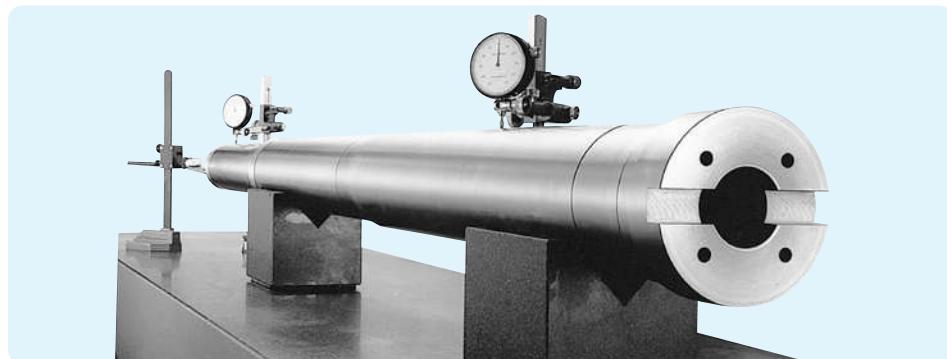

BT, BBT, HSK inner tapers, gauge and bearing matching, thread grinding, and many other spindle related machining are available.

Surface Treatments

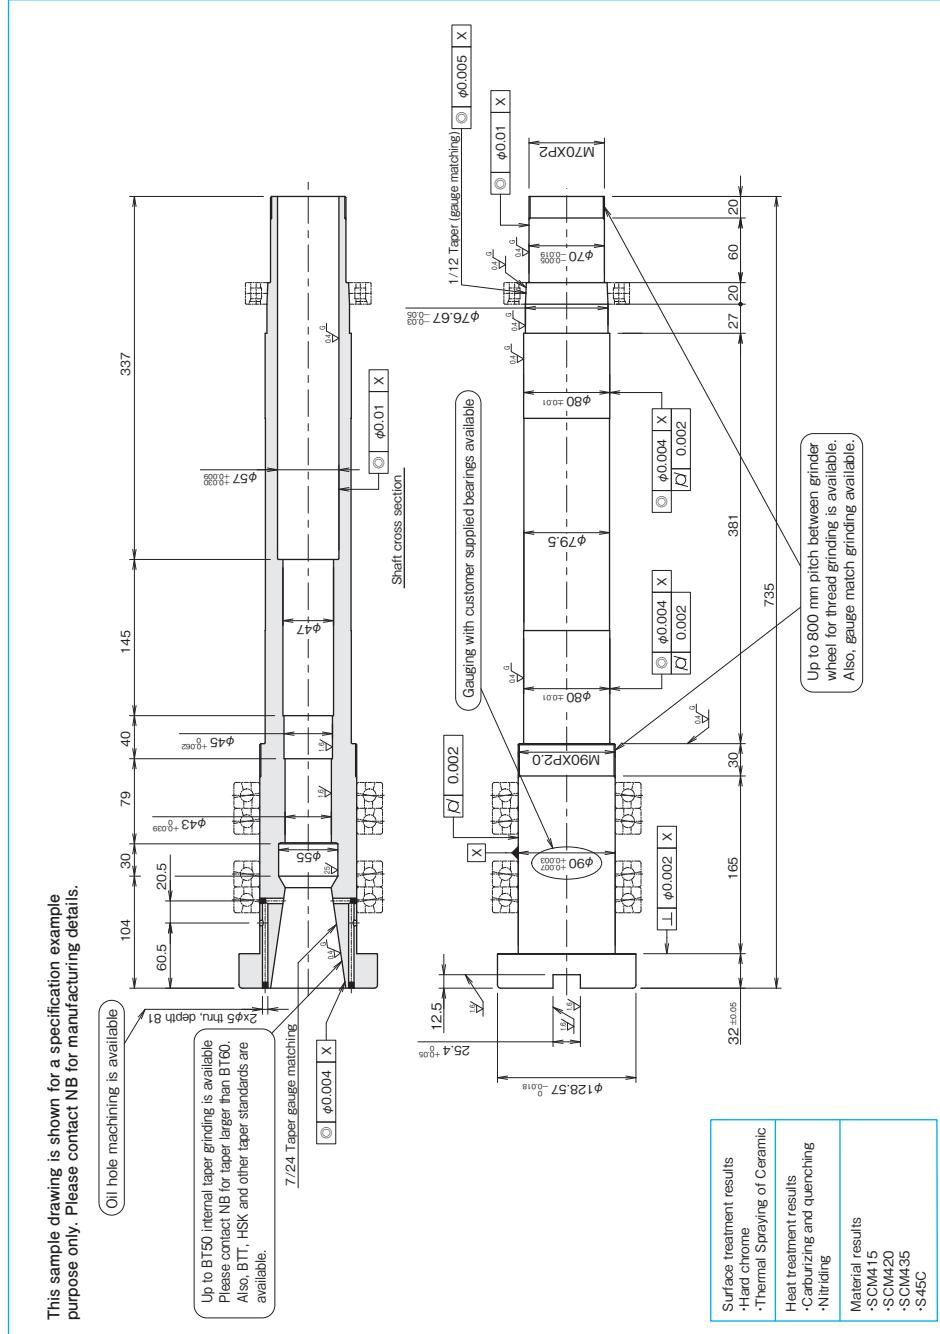

Various surface treatments are available such as hard chrome and ceramic coating. Repairing a damaged spindle with replate and grinding is also available.

SPINDLE UNIT M-BT TYPE/G-MA TYPE

NB Spindle Shaft is backed by decades of precision manufacturing experience as well as up to date manufacturing facility to meet demands. NB is capable of handling all your spindle needs such as manufacturing of bearing case and spindle base, design and manufacturing of spindle unit, and overhauling of spindles, other than standard spindle unit M-BT and G-MA type.

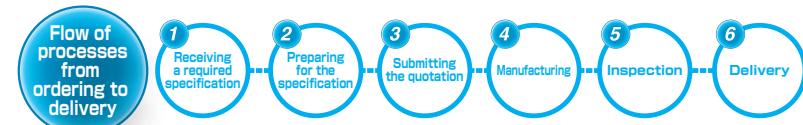

ADVANTAGES

- M-BT type is used in various cut processing machines and machining centers. It can be successfully operated having high rigidity and stability by utilizing angular ball bearings (the four-line combined) and double row cylindrical roller bearing.
- G-MA type is used in external grinding and flat surface grinding machines. It can be successfully rotated having high speed and stability by utilizing preloaded high accuracy angular ball bearings.
- Customised spindle units are available based on M-BT and G-MA type.
- M-BT and G-MA type can be used for long time coped with NB's overhaul.

SPECIAL REQUIREMENTS

Other than spindle units for machine tool, designing spindle units for various industrial machineries is available. Please feel free to contact NB when you take orders of spindle units.

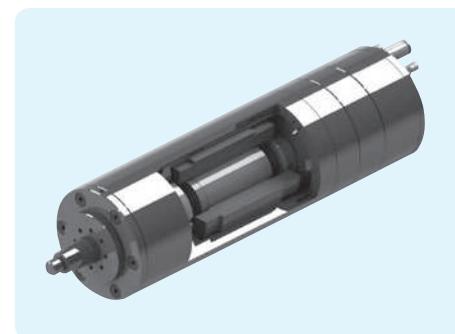

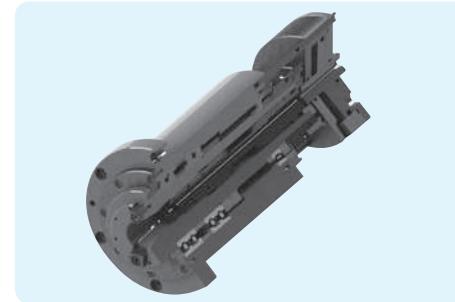

[Examples of special requirements]

M-BT: Modifying outer dimensions / Adding a pulley / Adding an unclamping cylinder / etc.

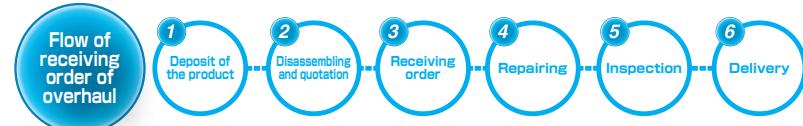

G-MA: Modifying shaft end machining / Adding a pulley / Adding a grindstone flange / etc.

EXAMPLES OF SPINDLE UNIT

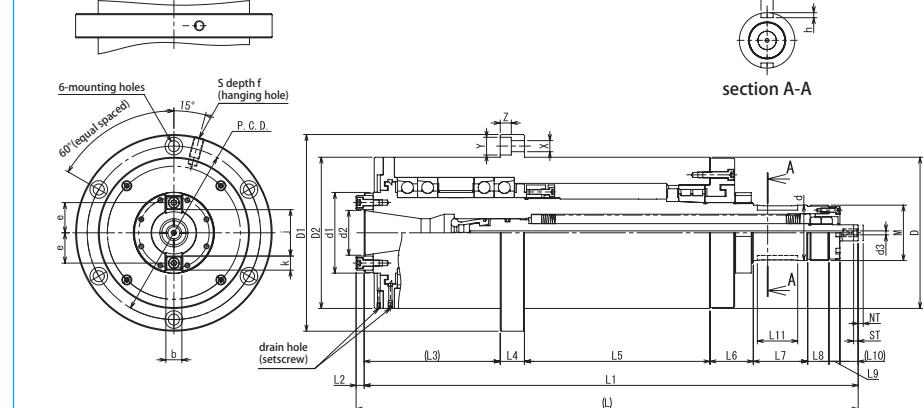

OVERHAUL

Also, other than NB's designed spindle unit can be overhauled. Please feel free to contact NB.

M-BT TYPE

- When mounting this model or mounting mounted object, please handle with the utmost care and avoid shock.
- This model doesn't come with lubrication mechanism. Amount of pre-applied grease is enough for use.
- When using this model for the first time or not using for a long time, perform the running-in operation properly.
- The figure shows, the position of draw bar is when clamping the tool.
- Only when unclamping, air blow from d3 through hole is possible. Please use dried and clean air for air blow.
- Do not rotate at a high speed without clamping the tool.
- The drain hole is plugged when shipping. Please open the drain hole by unplugged the setscrew as needed.
- This is horizontal mounting model. Please contact NB for vertical mounting model.

GENERAL MACHINE SHAFTING

NB general machine shafts are made to customer drawings. Integrated production from material sourcing, machining, heat treatments, surface treatments and final inspection, NB does it all.

ADVANTAGES

Small Lot Production Accepted

One piece custom accepted.

Variety of Machining Capabilities

From small to large, various shaft and spindle machining is available.

Surface Treatment

Various surface treatments are available such as hard chrome, electroless nickel plating, and low temperature black chrome.

Heat Treatment

Various heat treatments are available such as carburizing and induction hardening.

THERMAL-SPRAYING CERAMIC-COATING SPECIFICATIONS

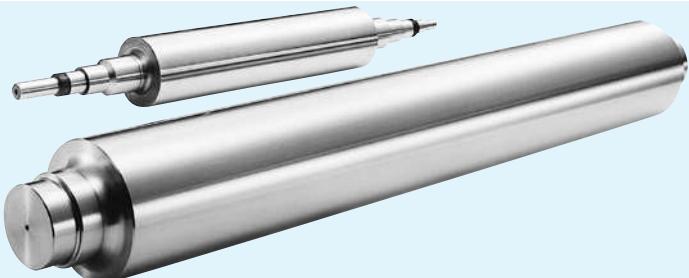

Parts that require wear and corrosion resistance can be thermal-sprayed with a ceramic material per NB's ceramic-coating specifications. Ceramic-coating can be applied to a wide variety of materials. The pores in the coated layer result in good lubrication characteristics and can be sealed to achieve high corrosion resistance.

Materials	High Carbon Chromium Bearing Steel (SUJ2)	Surface Treatment	Hard Chrome
	Chrome Molybdenum Steel (JIS SCM415, 420, 435)		Low Temperature Black Chrome
	Structural Carbon Steel (JIS S45C)		Electroless Nickel Plating
	Martensite Stainless Steel (SUS440)		Thermal Spray Ceramic Coating
	Austenite Stainless Steel (SUS303, 304)		Gauging with customer supplied nuts and bearings
	Tool Steel (JIS SK4)		Triangular and trapezoidal thread grinding available
	Tool Steel (JIS SKS3)		
Heat Treatment	Induction Hardening		
	Induction Hardening (deep)		
	Carburizing and quenching

SLIDE WAY

The NB slide way is a non-recirculating linear motion bearing utilizing precision rollers. It is used primarily in optical and measurement equipment where high precision movement is required.

STRUCTURE AND ADVANTAGES

The NB slide way NV type comprises of precisely ground rails and R-retainers with built-in STUDROLLERS and precision rollers. The rails have been optimally designed so that the STUDROLLERS move smoothly, and the STUDROLLERS and precision rollers incorporated in the R-retainers enable slip-free operation between the raceway surface and the rollers resulting in motion with minimal frictional resistance.

SV and SVW types consist of precision ground rails and precision caged-rollers. Since caged-rollers do not recirculate, there is only a minimum frictional resistance fluctuation. Also, there is a minimum difference between the static and dynamic frictional resistances.

Non-slip! STUDROLLER System (Rivet Roller Structure)

The STUDROLLER system is based on a new concept to provide complete prevention of roller cage slippage during operation. This system permits usage in all orientations and positions.

Figure G-1 STUDROLLER System

Suitable for Minute Motion

Because the frictional resistance is extremely small and there is only little difference between the static and dynamic frictional resistances, the NB slide way is well suited for minute motion, resulting in highly accurate linear movement.

Low-Speed Stability

Since the frictional resistance fluctuation is small even under low-load conditions, stable motion is obtained from low to high speeds.

High Rigidity and High Load Capacity

Compared to the ball elements, the rollers provide a larger contact area and less elastic deformation, thus the NB slide way has high rigidity and high load capacity. With new NV rail design, the roller contact area is increased by 30 to 58% (Figure G-2). The number of effective rollers is increased by narrowing the roller pitch. Thus, the NV type has the load rating that is 1.3 to 2.5 times that of the SV type.

Low Noise

The slide way never produces recirculation noise nor roller-contact noise due to a use of roller cage, resulting in quiet motion.

All Stainless Steel Type Available

The anti-corrosion SVS/SVWS/NVS-RNS slide ways have all stainless steel components, making them ideal for use in clean room applications.

Figure G-2 Roller Contact Profile

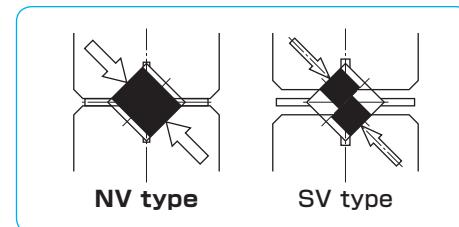

Figure G-3 Structure of NV type

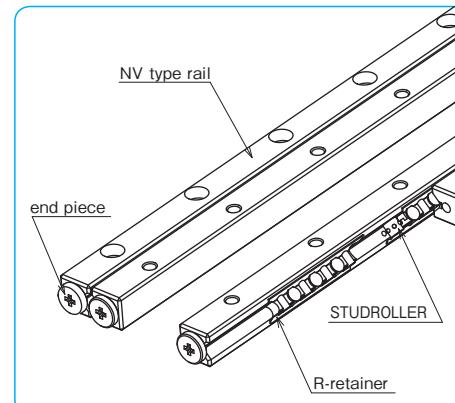

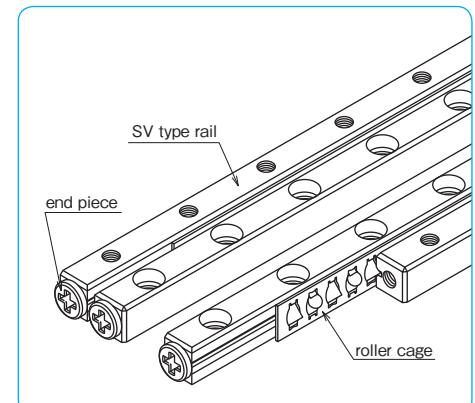

Figure G-4 Structure of SV type

※To the NV type, fastening plates are attached for the purpose of maintaining the center position of the R-retainer before assembly. Please see Installation Procedure on page G-7 and remove the fastening plates before use.

TYPES

NV type NVS-RNS type

P.G-12

The NV slide way consists of a set of four rails, two R-retainers, and eight end pieces. It permits flexible design of the table which will best suit your application. The NVS-RNS type has all stainless steel components, which is suitable for anti-corrosion, high temperature and vacuum requirements.

SV type

P.G-16

The SV slide way consists of a set of four rails, two R type roller cages, which have precision rollers in a cross arrangement, and eight end pieces. The all stainless steel option makes it suitable for use in corrosive environments.

SVW type

P.G-24

The SVW slide way consists of two SV-type rails, one W type rail, two R type roller cages, and eight end pieces. The use of a W-type rail serves for a compact design. The SVWS type is also available with all stainless steel components.

ACCURACY

The accuracy of the slide way is represented as parallelism measured across the full length with a method shown in Figure G-6. It is classified as high (blank), precision (P), or ultra precision (UP). Special accuracies can also be accommodated. Please contact NB for details.

Figure G-5 Parallelism

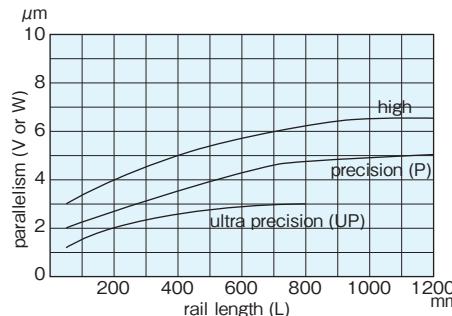

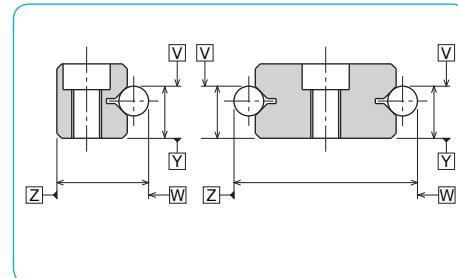

Figure G-6 Accuracy Measurement Method

Ultra precision grade is available from size 1 to size 9.

RATED LIFE

The life of the slide way and the slide table is calculated with the following equations:

Rated Life

$$L = \left(\frac{f_T}{f_W} \cdot \frac{C}{P} \right)^{10/3} \cdot 50$$

L: rated life (km) f_T: temperature coefficient f_W: applied load coefficient
C: basic dynamic load rating (N) P: applied load (N)

* Please refer to page Eng-5 for the coefficients.

Life Time

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L_h: life time (hr) l_s: stroke length (m)
n₁: number of cycles per minute (cpm)

LOAD RATING

The load rating for the slide way is obtained using the equations listed in Table G-1.

Table G-1 Load Rating

condition	double-rail parallel usage
direction of load	
basic dynamic load rating C	$C = \left[2P \left(\frac{Z}{2} - 1 \right) \right]^{\frac{1}{36}} \cdot \left(\frac{Z}{2} \right)^{\frac{3}{4}} \cdot 2^{\frac{7}{5}} \cdot C_1$ C: basic dynamic load rating (N) C ₁ : basic static load rating (N) F: allowable load (N)
basic static load rating Co	$Co = \frac{Z}{2} \cdot C_{01} \cdot 2$ C ₀₁ : basic dynamic load rating per roller (N) C ₀₁ : basic static load rating per roller (N) F ₁ : allowable load per roller (N)
allowable load F	$F = \frac{Z}{2} \cdot F_1 \cdot 2$ Z/2: number of effective rollers (round down to whole number) P: roller pitch (mm)

C: basic dynamic load rating (N)
C₀₁: basic static load rating (N)

F: allowable load (N)

C₁: basic dynamic load rating per roller (N)

C₀₁: basic static load rating per roller (N)

F₁: allowable load per roller (N)

Z/2: number of effective rollers (round down to whole number)

P: roller pitch (mm)

The load rating of the NV type differs depending on the direction of the load.

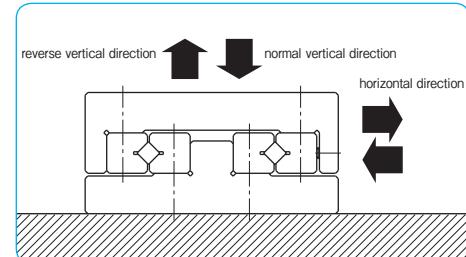

Table G-2 Change of Load Rating Corresponding to Load Direction

basic dynamic load rating	normal vertical direction	1.0 × C
	horizontal direction	0.85 × C
	reverse vertical direction	0.7 × C
basic static load rating	normal vertical direction	1.0 × C ₀₁
	horizontal direction	0.85 × C ₀₁
	reverse vertical direction	0.7 × C ₀₁

*There may be a difference depending on the size. Please contact NB for details.

Consideration has been given to holes for STUDROLLERS in the raceway surface in calculation of load ratings.

F₁: allowable load per roller C₀₁: static load rating per roller

STROKE

Please contact NB for a non-standard stroke length for the NV type. When the stroke of SV type or SVW type is changed, the stroke length must be determined and the load rating should be re-estimated as follows.

Stroke of SV type, SVW type

When the slide way moves along the rail, the cage moves half the distance traveled by the slide way in the same direction. Therefore, although the work may be fixed on the table, the distance between the load center and the cage center will change. To achieve stable accuracy, determine the stroke and the length of the rail as follows.

Figure G-8

Rail Length (L)

When the stroke is 400mm or over

$$S \leq L/1.5$$

When the stroke is less than 400 mm,

$$S \leq L$$

ℓ : cage length (mm) S: stroke (mm)

L: rail length (mm)

Cage length (ℓ)

$$\ell \leq L - \frac{S}{2}$$

Number of rollers (Z)

$$Z = \frac{\ell - 2a}{p} + 1$$

a,p: Please refer to roller cage dimensions
(page G-5)

LUBRICATION AND DUST PREVENTION

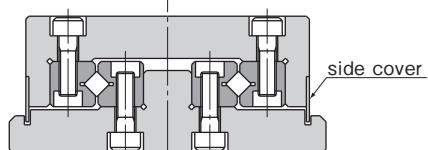

Lubrication

The slide way is pre-lubricated with lithium soap-based grease No.00 prior to shipment for immediate use. Make sure to relubricate with a similar type of grease periodically according to the operating conditions. NB also provides low dust generation grease. Please refer to page Eng-40 for details.

Dust Prevention

Foreign particles or dust in the slide way affects the motion accuracy and shortens the life time. In a harsh environment please provide side covers for dust prevention. (refer to Figure G-9)

Figure G-9 Example of Dust Prevention Mechanism

MOUNTING

Example

Figure G-10 NV type, SV type

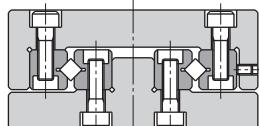

Figure G-11 SVW type

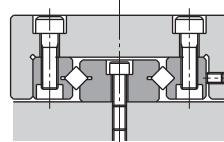

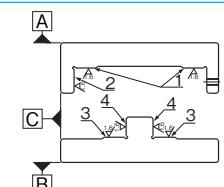

Figure G-12 Accuracy of Mounting Surface

SHAPE OF MOUNTING SURFACE

Slide way NV and SV types are generally mounted by contacting the reference surface of the rail to the shoulder provided on the mounting surface. For the shoulder shape, provide relief at the corner as shown in Figure G-13 so that it does not interfere with the reference corner of the rail.

If it is necessary to mount NV or SV types without relief, then it can be used with rounded corners as shown in Figure G-14. Table G-3 shows the corner radius of the mounting surface.

Figure G-13 Relief on the Mounting Surface

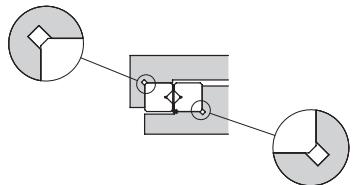

Figure G-14 Corner Radius

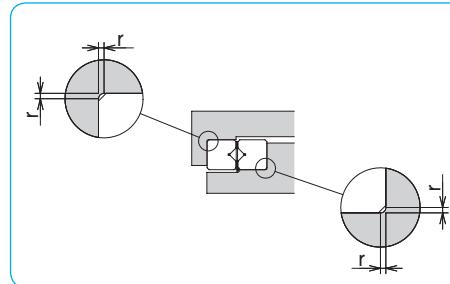

Table G-3 Maximum Corner Radius unit : mm

part number	maximum corner radius r
NV1, SV1	0.1
NV2, SV2	0.2
NV3, SV3	0.2
NV4, SV4	0.4
NV6, SV6	0.7
NV9, SV9	0.8
NV12, SV12	1.0

Accuracy of Mounting Surface

To maximize the performance of the NB slide way, it is recommended that the accuracy of the mounting surface to be equal to or greater than the degree of parallelism of the slide way.

- Parallelism of surface 1 against surface A
- Perpendicularity of surface 2 against surface A
- Parallelism of surface 3 against surface B
- Perpendicularity of surface 4 against surface B
- Parallelism of surface 2 against surface C
- Parallelism of surface 4 against surface C

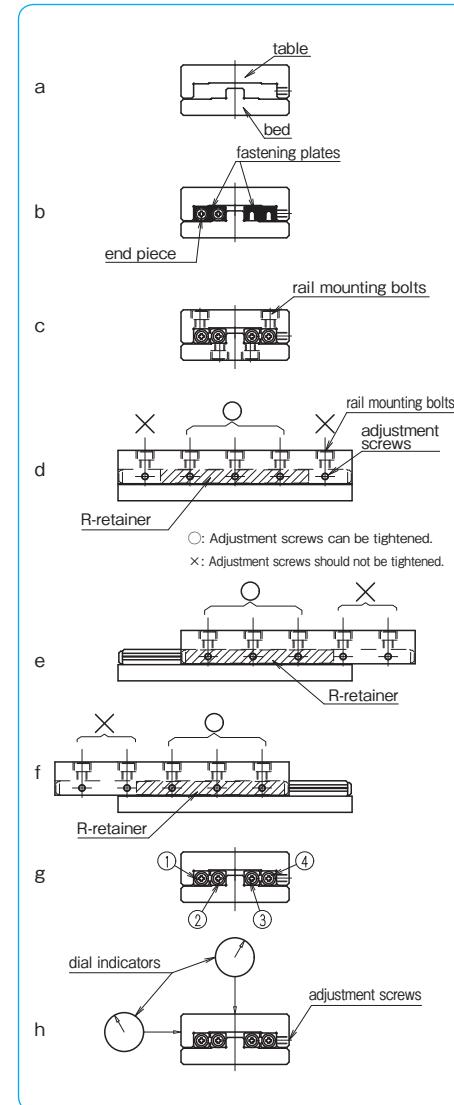

INSTALLATION PROCEDURE OF NV TYPE

Installation Procedure

*Please read "Use and Handling Precautions" before installation.

- (1) Remove burrs, scratches, and dust from the rail-mounting surface of the bed and the table, be careful to prevent contamination during assembly.
- (2) Apply low-viscosity oil to the contact surfaces, and align the bed and the table. (Figure G-13a)
- (3) Set the reference surface onto the mounting surface with the rails fastened. Set the table in the center position, and tighten the adjustment screws lightly so that almost no gap remains. (Figure G-13b)
- (4) Keep the table in the center, tighten the rail mounting bolts lightly, loosen the end pieces of both ends, and remove the fastening plates. Following this, lightly retighten the end pieces.
- (5) While maintaining the conditions of (4), gently move the assembly through its stroke to check if the maximum stroke is secured, and if there is no irregularity.
- (6) Move the table to the center and tighten only the adjustment screws on the R-retainer with the recommended torque shown in Table G-3. (Figure G-13c)
- (7) Gently move the table to one stroke end, and check that the table has surely come into contact with the external mechanical stopper. Following this, tighten the adjustment screws in the same manner as (6). (Figure G-13d)
- (8) Move the table to the opposite stroke end, and tighten in the same manner as (6). (Figure G-13e)
- (9) Fasten the mounting screws on rails 1, 2, and 3 by tightening with the recommended torque shown in Table G-4. (Figure G-13f)
- (10) Set the dial indicators to the center of the table and to the side (reference surface) of the table. (Figure G-13g)
- (11) Perform the final preload adjustment. While moving the table back and forth, repeat steps (6) to (8) until the dial indicators show a minimum deviation.
- (12) Fasten rail 4 securely with the recommended torque. As for the adjustment screws, successively tighten the rail mounting bolts on the R-retainer by moving the table.
- (13) Recheck the motion accuracy while moving the table.
- (14) Tighten the end pieces finally.

Figure G-15 Installation Method

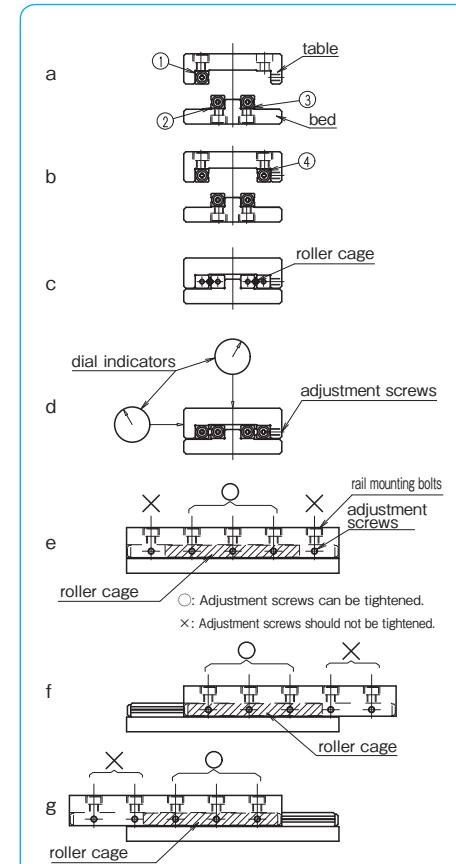

As d, e, f in the Figure shows it is recommended to match the position and pitch of adjustment screws with rail mounting bolts, and also the height of them with the same as the center of raceway groove.

INSTALLATION PROCEDURE OF SV TYPE

Installation Procedure

- (1) Remove burrs, scratches, and dust from the rail-mounting surface of the bed and the table, be careful to prevent contamination during assembly.
- (2) Apply low-viscosity oil to contact surfaces. Attach rails ①-③ by tightening bolts with the recommended torque (Table G-4). (Figure G-14a)
- (3) Temporarily attach rail ④ on the adjustment side. (Figure G-14b)
- (4) Remove end pieces on one end. Carefully insert roller cages between rails. (Figure G-14c)
- (5) Re-attach end pieces.
- (6) Move the table slowly to each stroke end to position roller cages at the center of the rails.
- (7) Set the dial indicators to the center of the table and to the side (reference surface) of the table. (Figure G-14d)
- (8) Move the table to one stroke end. Lightly tighten adjustment screws on the roller cage. (Figure G-14e)
- (9) Move the table to the opposite stroke end. Similarly lightly tighten adjustment screws on the roller cage. (Figure G-14f)
- (10) Move table to the center and lightly tighten center adjustment screws. (Figure G-14g)
- (11) Repeat steps (8) ~ (10) until the indicators show a minimum deviation. Please do not apply an excessive preload.
- (12) Make final adjustment of preload. Repeat steps (8) ~ (10) and tighten the adjustment screws with the recommended torque listed in Table G-3.
- (13) Fasten the rail ④ securely with the recommended torque. As with the adjustment screws, successively tighten the rail mounting bolts by moving the table.

Figure G-16 Installation Method

As e, f, g in the Figure shows it is recommended to match the position and pitch of adjustment screws with rail mounting bolts, and also the height of them with the same as the center of raceway groove.

Table G-4 Recommended Torque for Adjustment Screw Unit:N·m

(for steel alloy screw)

SPECIAL MOUNTING SCREW BT TYPE

In case of mounting slide way by screws from the counterbore side, threaded holes become the pilot holes. Thus, pilot hole's clearance will be less than a standard clearance hole for a screw. NB offers reduced shoulder screws for mounting SlideWay from bottom when larger screw clearance is required due to preload adjustment or inaccuracy of mating threaded holes. This special mounting screw made of alloy steel is stocked, and custom stainless steel version is available as a special order. Please contact NB for details.

USE AND HANDLING PRECAUTIONS

Careful Handling

Dropping the slide way causes the rolling elements to make dents in the raceway surface. This will prevent smooth motion and will also affect accuracy. Be sure to handle the product with care.

The NV type is packaged as a set of rails and R-retainers. Do not separate or disassemble until assembly/installation is completed. Precision is not guaranteed if disassembled.

Fastening Plates

For the NV type, fastening plates are attached at both end faces of the rails to maintain the R-retainer center position prior to assembly. The fastening plates are not required after the NV type is mounted to a table and bed, however, when removal of the NV type is necessary such as when it will be reassembled, be sure to return the R-retainer to the proper center position, secure the fastening plates with the end pieces, and then remove the NV type.

Specified Allowable Stroke

For the NV type, exceeding the specified stroke (over-stroke) shall cause the raceway surface of the rail to be damaged and the performance of the STUDROLLER to drastically deteriorate. Be sure to provide external mechanical stoppers.

Adjustment

Using the product with insufficient accuracy of the mounting surface or before adjusting the preload will cause the motion accuracy of the product to drop and will have a negative influence upon product life and accuracy. Make sure to assemble, install, and adjust the product with care.

Caution against Excess Preload

It is essential to give preload on the Slide Way products in order to assure rigidity and accuracy. However, excess preload causes damage on the raceways and roller cages/R-retainers. On installation, please follow the installation procedure and recommended torque on page G-9.

Operating Temperature

The NV type uses resin parts. Please use the product in environments that are lower than 80°C.

Use as a Set

The accuracy of the rails has been matched within each set. Note that the accuracy will be affected when the rails of different sets are combined.

Allowable Load

The allowable load is a load under which the sum of elastic deformations of the rolling element and the raceway in the contact area subject to the maximum contact stress is small enough to guarantee smooth rolling movement. When very smooth and highly accurate linear motion is required, make sure to use the product within the allowable load.

Cage Slippage

For the SV/SVW type, the cage can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is advised that the stroke be set with sufficient margin and an excessive preload should be avoided.

It is also recommended that the rails be cycled to perform the maximum stroke several times, so that the cage returns to its center position.

End Pieces

End pieces are attached to each end of the slide way to prevent removal of the cage. Do not use them as a mechanical stopper.

Knock Pin Hole

When using SVW type knock pin holes to attach a slide way, please do the hole-machining on the mounting surface after attaching the W type rail. After machining, remove the chips completely and wash as required.

SLIDE TABLE

The NB slide table is a precision table equipped with a slide way. Its high-precision and low-friction characteristics make it well suited for use in electronics automatic-assembly machines, optical measurement devices, etc.

STRUCTURE AND ADVANTAGES

The NB slide table consists of a slide way sandwiched between an accurately machined table and a bed. Stoppers are provided inside the table.

High Accuracy

The mounting surfaces of the table and bed are precision finished to ensure high precision linear motion, resulting in a high performance slide way.

Low Friction

Its non-recirculating mechanism provides stable motion at from low to high speeds.

Compact and High Rigidity

Being designed compactly, the NB slide table holds the high load capacity and high rigidity characteristics.

Figure G-18 Structure of NVT type

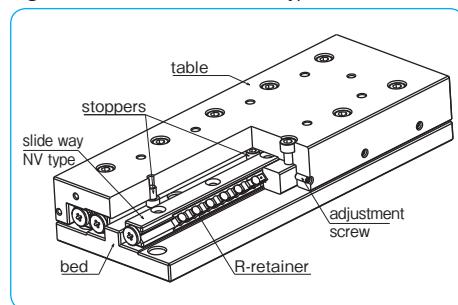

Figure G-19 Structure of NYT type

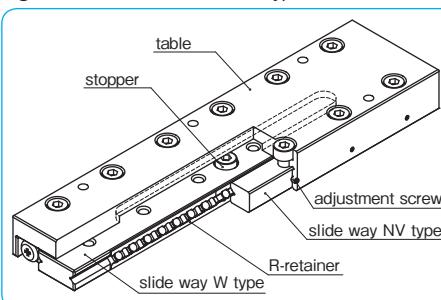

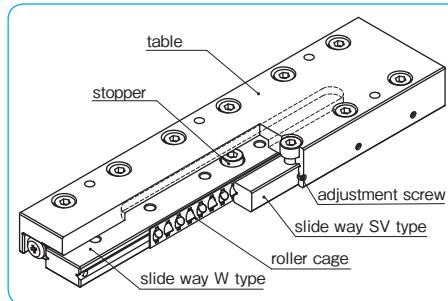

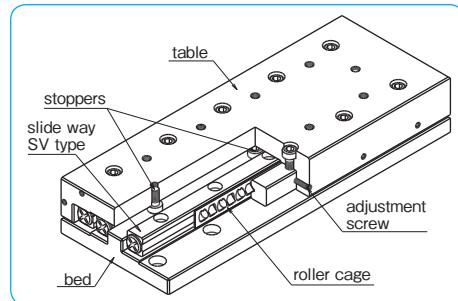

Figure G-20 Structure of SVT type

TYPES

NVT・NVTS type

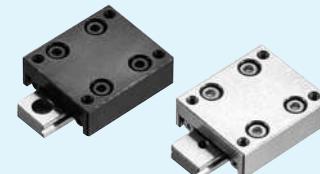

P.G-32

The NVT type slide table incorporates the NV type slide way. The table and bed have been precision machined to provide a high degree of accuracy and the product can be used, without any need for troublesome accuracy or preload adjustments.

In the NVTS type, the anti-corrosion NVS type slide way is sandwiched between an accurately machined aluminum table and bed.

NYT・NYTS type

P.G-36

The NYT/NYTS type is a thin, compact slide table, utilizing the studroller system. Either tapped or counterbore mounting type (D type) is available.

The anti-corrosion type NYTS slide table is made of all stainless steel components except for R-retainer.

SVT・SVTS type

P.G-40

In the SVT type slide table, the SV type slide way is sandwiched between an accurately machined steel table and bed.

In the SVTS type, the anti-corrosion SVS type slide way is sandwiched between an accurately machined aluminum table and bed.

SYT・SYTS type

P.G-46

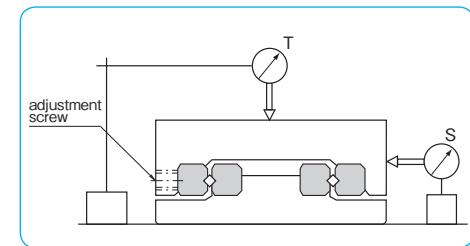

The SYT/SYTS type is a thin, compact slide table. Either tapped or counterbore type (D type) is available for the mounting hole.

The anti-corrosion SYTS type slide table is made of all stainless steel components, making it suitable for use in clean rooms.

ACCURACY

The motion accuracy of a slide table is measured by placing indicators at the center of the top and side surface of the table, as illustrated in Figure G-22. It is expressed in terms of the indicator deviation when the table is moved the full stroke without any load. For accuracy, please see the dimension tables.

Figure G-22 Accuracy Measurement Method

RATED LIFE

The life of an NB slide table is calculated using the following equations.

Rated Life

$$L = \left(\frac{f_T}{f_W} \cdot \frac{C}{P} \right)^{10/3} \cdot 50$$

L: rated life(km) f_T: temperature coefficient f_W: applied load coefficient
C: basic dynamic load rating(N) P: applied load(N)
※Please refer to page Eng-5 for the coefficients.

Life Time

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L_h: life time (hr) l_s: stroke length (m)
n₁: number of cycles per minute (cpm)

LOAD RATING

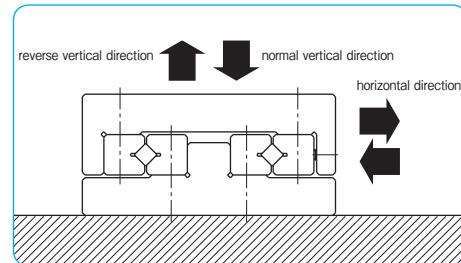

The load rating of the slide table NVT type and NYT type differs depending on the direction of the load.

Table G-7 Change of Load Rating Corresponding to Load Direction

basic dynamic load rating	normal vertical direction	1.0×C
	horizontal direction	0.85×C
	reverse vertical direction	0.74×C
basic static load rating	normal vertical direction	1.0×C ₀
	horizontal direction	0.84×C ₀
	reverse vertical direction	0.68×C ₀

※There may be a difference depending on the size.
Please contact NB for details.
Consideration has been given to holes for STUDROLLERS in the raceway surface in calculation of load ratings.

Figure G-23 Direction of Load

USE AND HANDLING PRECAUTIONS

Careful Handling

Dropping the slide table causes the rolling elements to make dents in the raceway surface. This will prevent smooth motion and will also affect accuracy. Be sure to handle the product with care.

Dust Prevention

Dust and foreign particles affect the accuracy and lifetime of a slide table. A slide table used in a harsh environment should be protected with a cover.

Lubrication

The slide table is prelubricated with lithium soap based grease No.00 prior to shipment for immediate use. Make sure to relubricate with a similar type of grease periodically depending on the operating conditions.

Cage Slippage

For the SVT/SYT type, the cage can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is advised

that the motion speed be kept under 0.5m/s under general operating conditions. It is also recommended that the rails be cycled to perform the maximum stroke several times, so that the cage returns to its central position.

Adjustment/Installation Screw

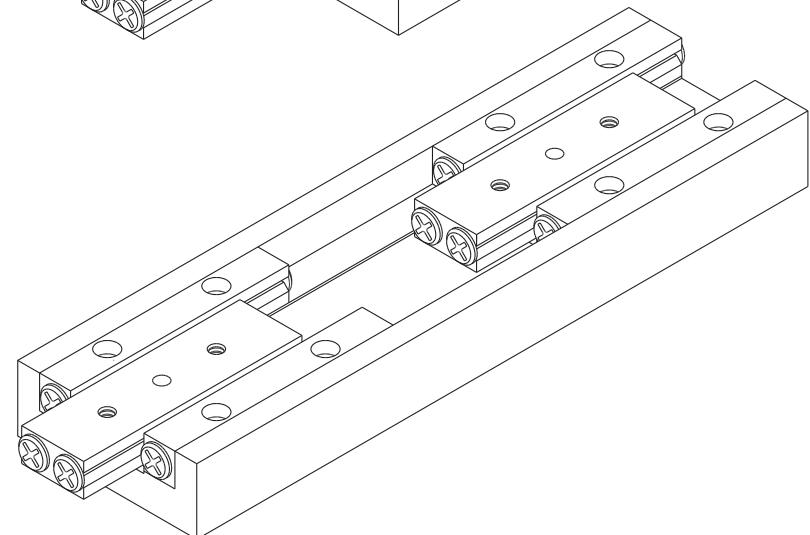

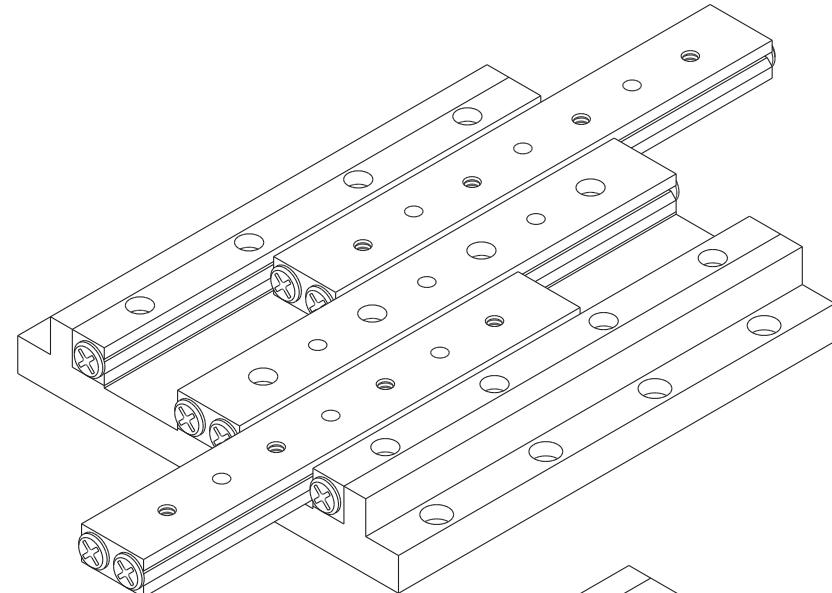

The NB slide table is adjusted to achieve optimum accuracy and preload. The adjustment screw and rail installation screws should be kept untouched.

Allowable Load

The allowable load is a load under which the sum of elastic deformations of the rolling element and the raceway in the contact area subject to the maximum contact stress is small enough to guarantee smooth rolling movement. When very smooth and highly accurate linear motion is required, make sure to use the product within the allowable load.

SPECIAL REQUIREMENTS

NB can machine tables to meet special requirements, including tables with a micrometer head and tables for projectors. Please contact NB for details.

MINIATURE SLIDE

The NB miniature slide SYBS type is a limited stroke table with the most compact envelope dimensions, featuring two ball raceway grooves. The SYBS type utilizes balls as the rolling elements. The ultra compact design contributes greatly to the creation of smaller and lighter industrial machinery and equipment of all types.

STRUCTURE AND ADVANTAGES

The NB miniature slide incorporates a unique integrated ball cage between the table and bed. All components have been produced with high precision machining.

Ultra Compact Design

The table height of the SYBS type is 3.2~8mm and the width is 6~17mm. This compact size when compared with conventional slide tables helps to realize the miniaturization of machinery and equipment.

Low Friction • Low Noise

Since the rolling ball elements do not recirculate, the frictional resistance will not vary significantly resulting in smooth, high precision operation. Additionally, the

ball cage greatly reduces the contact noise of the rolling elements bringing about a low-noise operation.

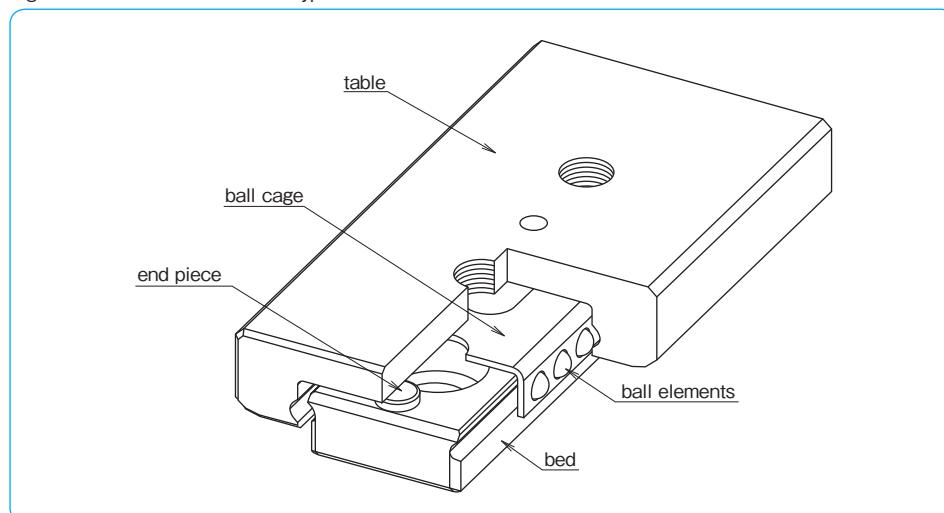

High Accuracy

The ball raceway grooves of each of the bed and table are processed through simultaneous precision machining resulting in minimal processing errors, and bringing about extremely smooth, precision linear movement.

Stainless Steel Structure

The SYBS type is made of all stainless steel components. This allows for use in corrosive or high temperature applications. The SYBS is a perfect component for vacuum or clean room environments.

Figure G-24 Structure of SYBS type

ACCURACY

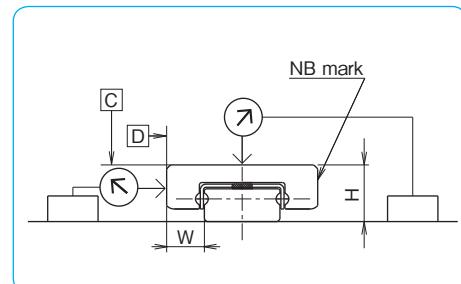

Table G-8 shows the accuracy of the SYBS miniature slide.

The deviation is measured as Figure G-25 illustrates. Dial indicators are placed to the center of the table's top and the reference surface side (opposite from the NB mark) and then the table is moved the full stroke without any load.

Table G-8 Accuracy unit : mm

item	tolerance
height H	±0.020
width W	±0.025
deviation from center of surface C	0.004
deviation from center of surface D	0.006

Figure G-25 Accuracy Measurement Method

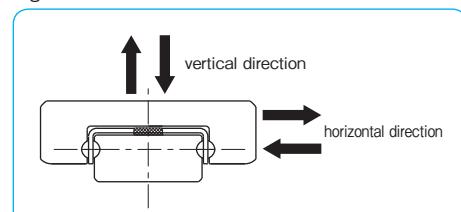

LOAD RATING

The load rating of the miniature slide varies depending on the direction of the applied load.

Table G-9 Change of Load Rating Corresponding to Load Direction

basic dynamic load rating	vertical direction	1.00×C
	horizontal direction	1.19×C
basic static load rating	vertical direction	1.00×Co
	horizontal direction	1.19×Co

Figure G-26 Direction of Load

RATED LIFE

The life of an NB miniature slide is calculated using the following equations:

Rated Life

$$L = \left(\frac{f_T}{f_W} \cdot \frac{C}{P} \right)^3 \cdot 50$$

L: rated life (km) f_T: temperature coefficient

f_W: applied load coefficient C: basic dynamic load rating (N)

P: applied load (N)

* Refer to page Eng-5 for the coefficient.

Life Time

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L_h: life time (hr) l_s: stroke length (m)

n₁: number of cycles per minute (cpm)

MOUNTING

Mounting Surface Profile

In most general installations, the miniature slide is mounted by pushing the reference surface of the bed and table against a shoulder that is set up on the mounting surface. Machined undercuts should be used in the corners of the shoulder (as illustrated in Figure G-27) so that the corners will not interfere with the reference surfaces of the bed and table. Table G-10 lists the recommended shoulder heights of the mounting reference surfaces.

When installing the miniature slide table without providing machined undercuts, the corner radius should be realigned as illustrated in Figure G-28. Table G-11 lists the values of the corner radius of the mounting surface.

Figure G-27 Mounting Surface Profile-1

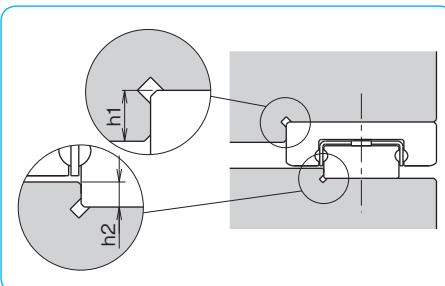

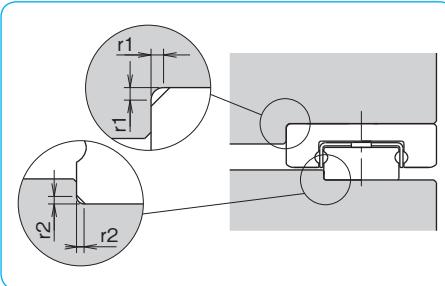

Figure G-28 Mounting Surface Profile-2

Recommended Torque Value

The bed should be tightened with a consistent torque by using a torque wrench. Table G-12 lists the recommended torque.

Table G-12 Recommended Torque unit : N·m

size	torque

Mounting Example and Mounting Screw

All the mounting holes are for SYBS6,8,12 fully through-hole. Mount SYBS6,8,12 as illustrated in Figure G-30 after considering the size of mounting screw, the maximum penetration depth, and the height of the bed. Make certain that the mounting screws do not interfere with the ball cage; otherwise, the accuracy and travel life will be affected adversely. Special screws for SYBS type are available from NB. Please refer to Table G-13 for dimensions of mounting screws.

USE AND HANDLING PRECAUTIONS

Preload

The SYBS miniature slide is provided with a slightly positive clearance type only.

End Piece

On both ends of the SYBS miniature slide bed section, screws are attached to prevent the ball cage from escaping. Please note that the screws are designed only to prevent the ball cage from escaping and are not intended for the use as a mechanical stopper. The ball cage may become deformed on contact with the stopper and this will result in a negative affect of the accuracy and travel life.

Lubrication

NB miniature slide SYBS type is supplied with an initial application of lithium soap grease No.0 and therefore is ready for immediate use. Make sure to relubricate with a similar type of grease periodically according to the operating conditions. For use in clean rooms or vacuum environments, miniature slide tables without grease or with customer specified grease are available. NB also provides low

dust generation grease. Please refer to page Eng-41 for details.

Cage Slippage

For the SYBS type, the cage can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is advised that the motion speed be kept under 0.5m/s under general operating conditions. It is also recommended that the table be cycled to perform the maximum stroke several times, so that the cage returns to its center position.

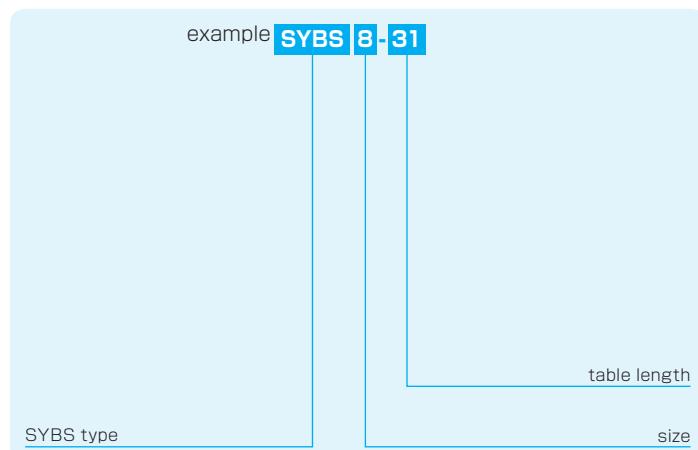

Allowable Load

The allowable load is a load under which the sum of elastic deformation of the rolling element and the raceway in the contact area subject to the maximum contact stress is small enough to guarantee smooth rolling movement. When very smooth and highly accurate liner motion is required, make sure to use the product within the allowable load values.

GONIO WAY

The NB gonio way is a curved cross roller slide way. It is a curved motion bearing utilizing low-friction, non-recirculating precision rollers. It is used when there is a need to change the gradient or obtain an accurate gradient angle without changing the center of rotation in high-precision optical and measurement equipment.

STRUCTURE AND ADVANTAGES

The NB gonio way RVF type consists of curved tracking bases with precisely ground V-grooves and flat installation surfaces, as well as curved roller cages. The NB gonio way RV type consists of curved rails with precisely machined V-grooves and curved roller cages. Precision rollers are employed as the rolling elements, since the rolling elements do not recirculate, the frictional resistance will not vary significantly, providing curved movement with extremely low frictional resistance.

Low Frictional Resistance and Minute Motion

The precision grinding and curved roller cage allow for extremely low frictional resistance. The negligible difference between static and dynamic frictions allows the gonio way to follow minute movements accurately, realizing curved movement of high accuracy.

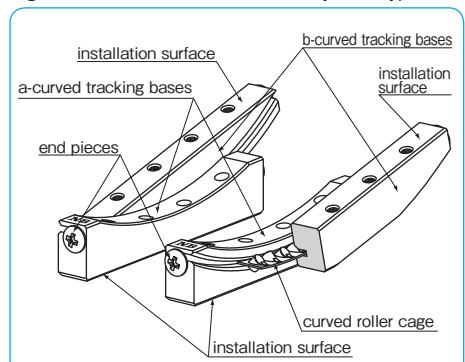

Low Noise

Since NB gonio way employs a non-recirculating design, there is no noise from the circulating area. In addition, the curved roller cage realizes quiet operation without contact noise between the rolling elements.

High Rigidity and High Load Capacity

The rollers provide a larger contact area and less

Figure G-32 Structure of Gonio Way RVF type

elastic deformation compared to the ball elements. Additionally, since the rollers do not recirculate, the effective number of rotating elements is larger, resulting in high rigidity and high load capacity.

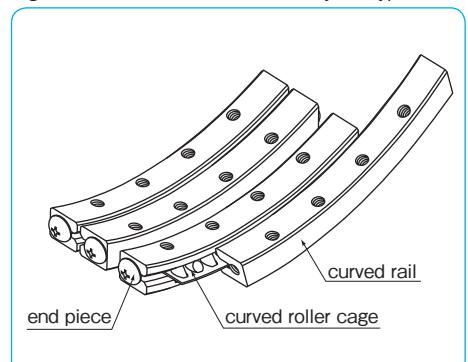

Flat Installation Surface

The flat installation surfaces of the RVF type do not require complicated machining of tables and beds when installing the product. As a result, machining costs can be reduced greatly.

Same Rotation Center

The curved V-grooves, which are finished with a precise grinding process, provide an accurate center of rotation. Furthermore, the products are composed to provide identical rotation centers when products of each size are installed to two axes. (refer to Table G-19.)

Figure G-33 Structure of Gonio Way RV type

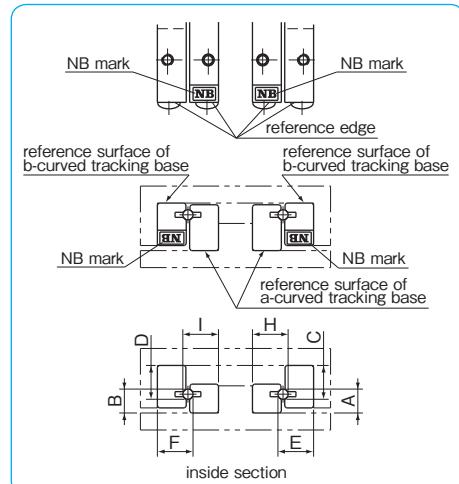

ACCURACY OF RVF TYPE

The accuracies of the gonio way RVF type are represented by mutual dimensional errors of four rails, which are measured along the overall length using the procedure as shown in Figure G-34.

Table G-14 Accuracy unit: μm

part number	mutual error between A and B mutual error between C and D	mutual error between E and F mutual error between H and I

RV3070-110	10
RV3100-160	

Figure G-35 Accuracy Measuring Method

The reference surfaces are located on the opposite side of the NB mark. There are inner reference surface and outer reference surface in one set of RV.

RATED LIFE

The life of a gonio way is obtained using the following equations.

Rated Life

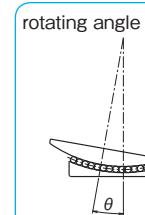

$$L = \frac{90}{\theta} \times \left(\frac{f_T}{f_w} \times \frac{C}{P} \right)^{\frac{10}{3}}$$

L: travel life (10^6 cycles) θ : rotating angle (degree)
C: basic dynamic load rating (N) P: applied load (N)
 f_T : temperature coefficient f_w : applied load coefficient
*Refer to page Eng-5 for the coefficients.

Life Time

$$L_h = \frac{L \times 10^6}{60 \times n}$$

L_h : life time (hr)
 n : number of cycles per minute (cpm)

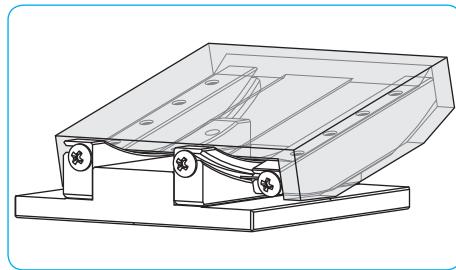

MOUNTING OF RVF TYPE

Accuracy of Mounting Surface

To maximize the performance of NB gonio way, it is important to finish the installation surface with high accuracies.

- Parallelism of surface 1 against surface A
- Perpendicularity of surface 2 against surface A
- Perpendicularity of surface 5 against surface A
- Parallelism of surface 3 against surface B
- Perpendicularity of surface 4 against surface B
- Perpendicularity of surface 6 against surface B
- Parallelism of surface 2 against surface C
- Parallelism of surface 4 against surface C

Figure G-37 Example of Installation of RVF type

Installation Procedure

Setting the curved tracking bases temporarily

- (1) Remove burrs, stains, and dust from the installation surfaces of the curved tracking bases of tables and beds. Foreign particles must be kept out of the assembly work as well.
- (2) Apply low viscosity oil to contact surfaces, check the reference edges of an a-curved tracking base and bed, and then tighten the screws temporarily. (Figure G-38a)
- (3) Align the reference edges (NB mark side) of a b-curved tracking base and an a-curved tracking base to the same orientation. Then, insert the curved roller cages between the curved tracking bases at the center area. Make sure that the curved roller cages will not interfere with the curved raceway grooves of the curved roller tracking bases. (Figure G-38b)
- (4) Check the reference edge of the table, set the table over the b-curved tracking base, and then secure the table temporarily. (Figure G-38c)

Figure G-36 Accuracy of Mounting Surface

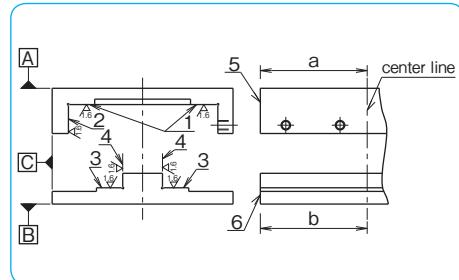

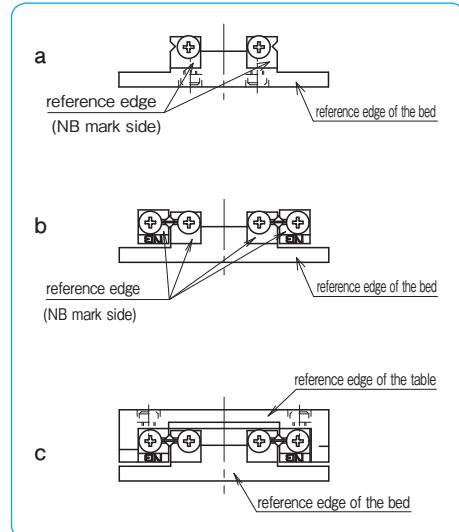

Figure G-38 Installation Method (1)

Setting four curved tracking bases in parallel position

- (5) Move the table to the maximum stroke ends of both sides and adjust the setting so that the curved roller cage is positioned at the center of the curved tracking base.
 - (6) Move the table to the center position and tighten the adjustment screws with "slightly strong torque" by using a torque wrench. (Figure G-39d)
- *"Slightly strong torque" here means slightly stronger than the torque at which the oscillation of the dial indicator is stabilized at the minimum value when the table is moved right and left, or when pressure is applied to the rolling direction while the dial indicator is attached to the side face (reference side) of the table. (Figure G-39i)
- (7) Move the table to the maximum stroke end of one side and tighten the adjustment screws on the curved roller cage with the same torque as in step (6). (Figure G-39e)
 - (8) Move the table to the maximum stroke end of the other side and tighten the adjustment screws with a torque wrench by repeating the procedure above. (Figure G-39f)

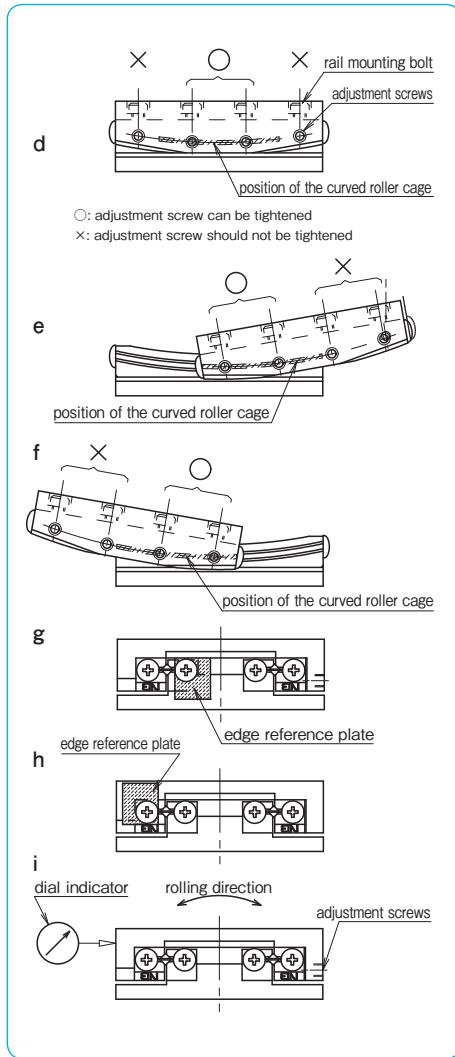

Securing the curved tracking bases

- (9) Mount an edge reference plate between the reference edge of the a-curved tracking base and end piece, press it against the reference edge of the bed, and then tighten only the rail mounting bolts in the middle. (Figure G-39g)
- (10) Repeat the procedure above to mount an edge reference plate between the reference edge of the b-curved tracking base and the end piece. Press it against the reference edge of the bed, and then tighten only the rail mounting bolts in the middle. (Figure G-39h) In order to maintain parallelism of curved tracking bases, do not cycle the table during this process and make sure that there is no clearance between the edge of the table and the edge reference plate.
- (11) Secure the rest of the rail mounting bolts on the curved roller cage one by one by moving the table as instructed in steps (7) and (8).

Adjusting the preload

- (12) Move the table to the right and left with the test indicator attached to the side face of the table (reference side). Or, apply pressure in the rolling direction and confirm that the oscillation of the indicator is stabilized at the minimum level. (Figure G-39i)
- (13) Return the rail mounting bolts on the b-curved tracking base at the adjustment screw side to the temporary setting.
- (14) Return the table to the center position, slightly loosen the adjustment screws in the middle, and then gradually loosen the adjustment screws on the curved roller cage while moving the table as instructed in steps (7) and (8). Make sure not to reduce the preload too much.
- (15) Finally, secure the b-curved tracking base at the adjustment screw side, which has been installed temporarily. Secure the rail mounting bolts on the curved roller cage one by one by moving the table as instructed above.

Figure G-39 Installation Method (2)

As d, e, f in the Figure shows it is recommended to match the position and pitch of adjustment screws with rail mounting bolts, and also the height of them with the same as the center of raceway groove.

Table G-16 Recommended Torque for Rail Mounting Bolts

MOUNTING OF RV TYPE

Accuracy of Mounting Surface

The accuracy of surfaces 1, 2, 3, and 4 (Figure G-40) directly affect the motion accuracy.

To maximize the performance of NB gonio way, it is important to finish the installation surface with high accuracies.

Figure G-40 Accuracy of Mounting Surface

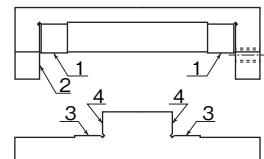

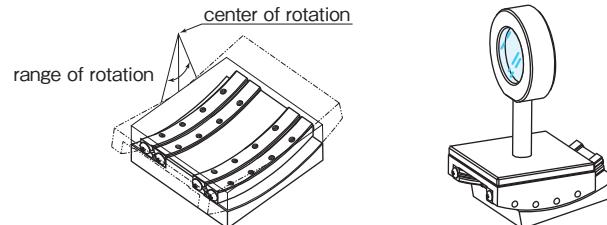

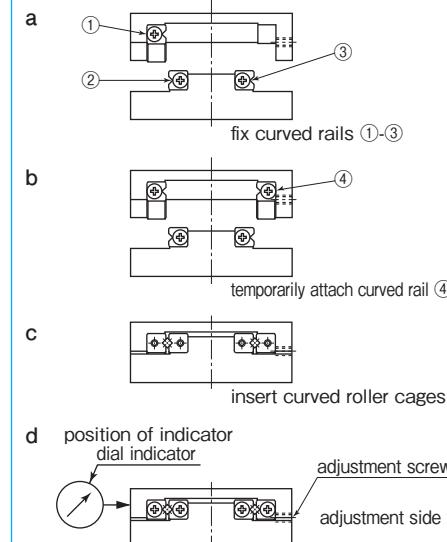

Figure G-41 Example of Installation

Installation Procedure

- (1) Remove burrs, dirt, dust, etc. from the table and the installation surfaces of the bed.
- (2) Apply a low viscosity oil to contact surfaces. Fix the rail ①inner-diameter reference surface, ②outer-diameter reference surface and ③outer-diameter reference surface by tightening bolts to the specified torque. (Table G-17, Figure G-42a)
- (3) Temporarily attach the rail ④inner-diameter reference surface on curved rail to the adjustment side. (Figure G-42b)
- (4) Remove the end pieces on one side of the rails and insert roller cages to the center. (Figure G-42c)
- (5) Re-attach end pieces.
- (6) Move the table to the right and left (in the direction of the stroke) to position roller cages at the center of the curved rails.
- (7) Set an indicator at the side of the table on the reference surface. (Figure G-42d)
- (8) Move the table to one of the stroke ends and tighten the adjustment screws slightly. (Figure G-43e)

Figure G-42 Installation Method (1)

(9) Move the table fully to the other stroke end and tighten the adjustment screws slightly. (Figure G-43f)

(10) Move the table to the center and lightly tighten adjustment screws. (Figure G-43g)

(11) Repeat steps (8)~(10) until there is no clearance around the table. If there is no clearance, the indicator will show a minimum fluctuation value when the table is moved to the right and left. Exercise care so as not to apply an excessive preload.

(12) Repeat steps (8)~(10) and tighten the adjustment screws uniformly by using a torque wrench.

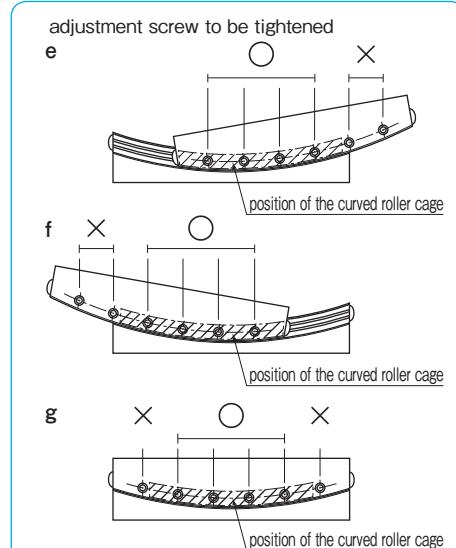

(13) Fix the rail ④inner-diameter reference surface. Tighten the rail mounting bolts sequentially by moving the table in the same manner as with the adjustment screws.

Table G-17 Recommended Torque for Rail Mounting Bolt
unit:N·m

size	torque
M3	1

(for stainless steel screw A2-70)

Figure G-43 Installation Method (2)

○: Adjustment screws can be tightened.
×: Adjustment screws should not be tightened.

SHAPE OF MOUNTING SURFACE

Slide way RVF and RV types are generally mounted by contacting the reference surface of the rail to the shoulder provided on the mounting surface. For the shoulder shape, provide relief at the corner as shown in Figure G-44 so that it does not interfere with the reference corner of the rail.

If it is necessary to mount RVF or RV types without relief, then it can be used with rounded corners as shown in Figure G-45. Table G-18 shows the corner radius of the mounting surface.

Figure G-45 Corner Radius

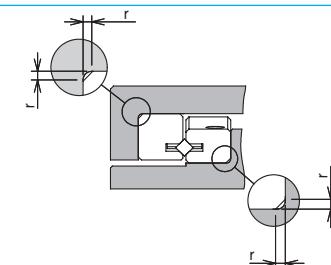

Figure G-44 Relief on the Mounting Surface

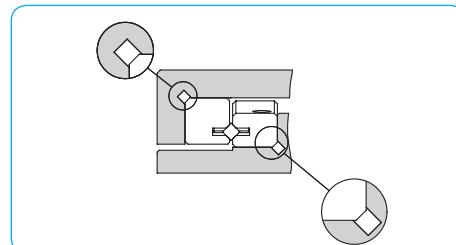

Table G-18 Maximum Corner Radius
unit : mm

part number	maximum corner radius <i>r</i>
RVF2 RV2	0.05
RVF3 RV3	0.1

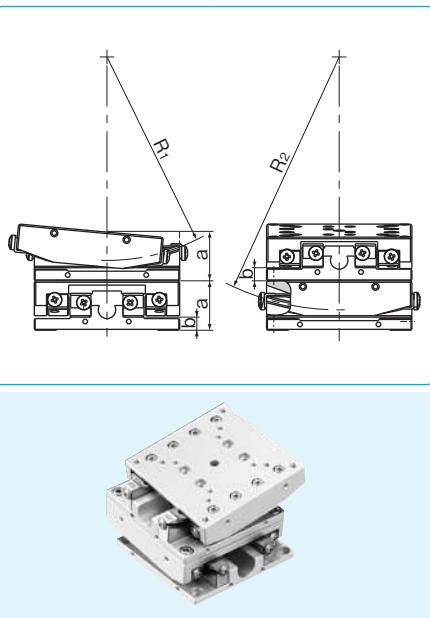

RVF TYPE 2 AXES AND SPECIAL SPECIFICATIONS

When incorporating RVF type units onto two axes as illustrated in Figure G-44, adjust the height of one lifting axis as instructed in Table G-17. Then, adjust dimension b (the height of the installation surface of the a-curved tracking base) in Figure G-44 according to the table in order to obtain the identical rotation center for the two axes. In addition, requests can be made for custom specifications including table units fitted for two axes, non-standard lengths for curved tracking bases, the radius of rotation, the rotation range, and the number of rollers. Contact NB for further information.

USE AND HANDLING PRECAUTIONS

Lubrication

NB gonio ways are lubricated using lithium soap No.00 based grease prior to shipment, so they can be used immediately. Make sure to relubricate with a similar type of grease periodically according to the operating conditions. NB also provides low dust generation grease for the linear system. Please refer to page Eng-41 for further details.

Dust Prevention

If a foreign matter, such as dust and dirt, enters the inside of the NB gonio way, it will deteriorate the accuracy and life of the system. A gonio way used in a harsh environment should be protected with a cover.

Operating Environment

The recommended operating temperature range of the NB gonio way is -20°C to 110°C .

Adjustment

Inaccuracy in mounting surface or improper adjustment of preload will reduce the motion accuracy, resulting in skewing and shortening of gonio way life. The adjustment should be carried out carefully.

Cage Slippage

For the NB Gonio Way, the cage can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is recommended that the rotation range be set with sufficient margin and an excessive preload should be avoided. It is also recommended that the rails be cycled to perform the maximum stroke several times, so that the cage returns to its center position.

End Pieces

End pieces are attached to each end of the NB gonio way to prevent removal of the curved roller cage. Do not use as a mechanical stopper.

Careful Handling

Dropping the NB gonio way causes the rolling elements to make dents in the raceway surface. This will prevent smooth motion and will also affect accuracy. Be sure to handle the product with care.

Use as a Set

The accuracy of the rails has been matched within each set. Note that the accuracy will be affected when the rails of different sets are combined.

Allowable Load

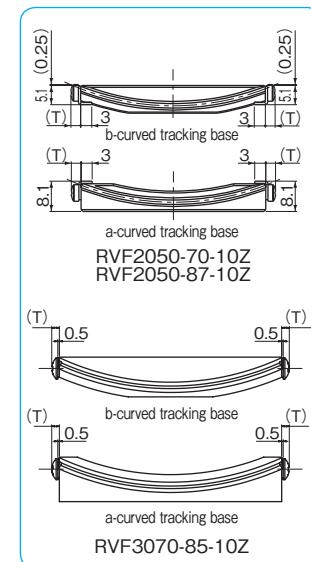

The allowable load is a load under which the sum of elastic deformation of the rolling element and the raceway in the contact area subject to the maximum contact stress is small enough to guarantee smooth rolling movement. When very smooth and highly accurate motion is required, make sure to use the product within the allowable load.

ADJUSTMENT FREE, SPACE SAVING, HIGH ACCURACY, HIGH RIGIDITY

SINGLE AXIS ACTUATOR

BG・BH series is a compact single axis actuator which integrates a slide guide and precision ballscrew.

BG type

PH-10

BH type

PH-82

ADVANTAGES

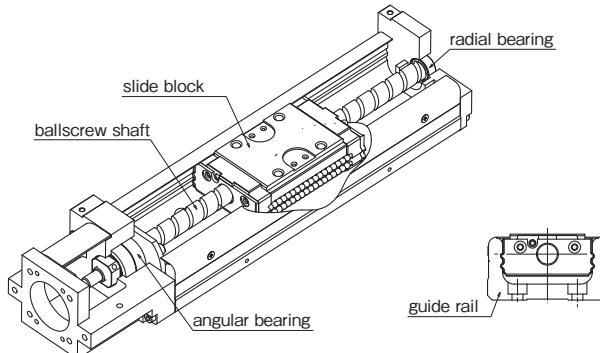

Adjustment Free (Built-in support unit)

Built-in support unit and integration of the slide guide and precision ballscrew eliminates complex precision adjustment and reduces installation time dramatically.

Space Saving (Low height profile)

The "U" shaped guide rail and integrated slide block and precision ballscrew make compact designs.

Figure H-1 Structure

High Accuracy (Precisely evaluated, precisely guaranteed)

BG series precision grade (P) guarantees positioning repeatability $\pm 1 \mu\text{m}$.

Inspection data sheet is attached to BG series only, measured value can be confirmed.

Table H-1 Accuracy

part number	BG series		BH series	
accuracy grade symbol	P grade	H grade	U grade	W grade
positioning repeatability	$\pm 1 \mu\text{m}$	$\pm 3 \mu\text{m}$	$\pm 5 \mu\text{m}$	$\pm 10 \mu\text{m}$

High Rigidity (Gothic arch groove profile)

Four or two-circuit and four-point contact structure in linear motion part provide very high rigidity.

And "U" shaped guide rail provide very high rigidity against bending moment and deflection and can be used for cantilevered application.

Figure H-2 Block Displacement against Radial Load

RATED LIFE

To obtain the rated life of the BG・BH type, calculate the rated life of the guide portion, ballscrew portion and support bearing portion. Use the minimum value as the rated life of the BG and BH type.

A. Life of Guide Portion

Use the following equation for calculating the rated life of guide portion.

$$L_g = \left(\frac{f_c}{f_w} \cdot \frac{C}{P_T} \right)^3 \cdot 50 \quad \dots \dots \dots (1)$$

L_g : rated life (km) f_c : contact coefficient (refer to Table H-6) f_w : applied load coefficient (refer to Table H-7) C : basic dynamic load rating (N) P_T : calculated load applied to one block (N)

A.1. Calculation of P_T

Before calculating the rated life using the equation (1), the calculated load applied to one block (P_T) needs to be obtained in consideration of the moment load, etc. that will be actually applied.

For rapidly-accelerating or short stroke motion, P_T needs to be calculated with acceleration taken into consideration. The calculation of this acceleration will be carried out for the mass applied to BG・BH.

Obtain the calculated load during uniform motion, acceleration, and deceleration, and use the average value of the three as P_T .

For the calculation of P_T , select an appropriate equation depending on the installation conditions of the guide.

It is also possible to calculate P_T without including the effect of acceleration by using the equation " $P_T = P_{TC}$ " (see the equations (2), (5), and (8)). In this case, however, the obtained value is a rough approximation, so a selection with sufficient margin is recommended.

Table H-6 Contact Coefficient (f_c)

number of blocks in close contact on one axis	contact coefficient (f_c)
1	1.0
2	0.81

Table H-7 Applied Load Coefficient (f_w)

operating conditions vibration, impact	velocity	applied load coefficient (f_w)
none	0.25m/s or less	1.0 ~ 1.5
low	1m/s or less	1.5 ~ 2.0
high	1m/s or more	2.0 ~ 3.5

*The E2 coefficient is for two blocks being used in close contact.

A.1.a. P_T for Horizontal Move (Horizontal Mounting)

i) during uniform motion (P_{TC})

$$P_{TC} = \frac{1}{n} \cdot W + E_P \cdot M_{PL} + E_Y \cdot M_{YL} + E_R \cdot M_{RL} \dots \dots \dots (2)$$

ii) during acceleration (P_{Ta})

$$P_{Ta} = \frac{1}{n} \cdot W + E_P (M_{PL} + m \cdot \alpha_a \cdot Z) + E_Y (M_{YL} + m \cdot \alpha_a \cdot X) + E_R \cdot M_{RL} \dots \dots \dots (3)$$

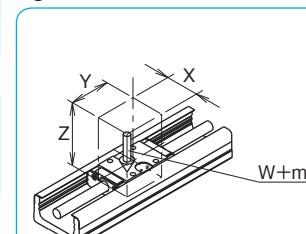

Note that the values of $(M_{PL} + m \cdot \alpha_a \cdot Z)$ and $(M_{YL} + m \cdot \alpha_a \cdot X)$ will be treated as 0 (zero) when the calculated value is negative.

iii) during deceleration (P_{Td})

$$P_{Td} = \frac{1}{n} \cdot W + E_P (M_{PL} + m \cdot \alpha_d \cdot Z) + E_Y (M_{YL} + m \cdot \alpha_d \cdot X) + E_R \cdot M_{RL} \dots \dots \dots (4)$$

Note that the values of $(M_{PL} + m \cdot \alpha_d \cdot Z)$ and $(M_{YL} + m \cdot \alpha_d \cdot X)$ will be treated as 0 (zero) when the calculated value is negative.

Figure H-4

In case of load coming from different direction other than the direction shown in the drawing $W+m$, please contact NB.

P_{TC} : calculated load applied to a block during uniform motion (N) P_{Ta} : calculated load applied to a block during accelerating (N) P_{Td} : calculated load applied to a block during decelerating (N) n : number of blocks of BG・BH W : applied load (N) m : carrying mass (kg)

α_a : acceleration during accelerating (m/sec^2) α_d : acceleration during decelerating (m/sec^2) (the negative value)

X : distance between the center of BG・BH and the center of the carrying mass (mm) Y : distance between the center of BG・BH and the center of the carrying mass (mm) Z : distance between the center of BG・BH ballscrew and the center of the carrying mass (mm) E_P : moment equivalent coefficient in the pitching direction (refer to Table H-8)

E_Y : moment equivalent coefficient in the yawing direction (refer to Table H-8) E_R : moment equivalent coefficient in the rolling direction (refer to Table H-8) M_{PL} : applied moment in the pitching direction (N・mm) $M_{PL}=W \cdot Y$ M_{YL} : applied moment in the yawing direction (N・mm) $M_{YL}=0$ (This case is not applicable) M_{RL} : applied moment in the rolling direction (N・mm) $M_{RL}=W \cdot X$ *Refer to Fig. H-8 for the direction of moment.

A.1.b. P_T for Horizontal Move (Wall Mounting)

i) during uniform motion (P_{TC})

$$P_{TC} = \frac{1}{1.19 \cdot n} \cdot W + E_P \cdot M_{PL} + E_Y \cdot M_{YL} + E_R \cdot M_{RL} \dots \dots \dots (5)$$

ii) during acceleration (P_{Ta})

$$P_{Ta} = \frac{1}{1.19 \cdot n} \cdot W + E_P (M_{PL} + m \cdot \alpha_a \cdot Z) + E_Y (M_{YL} + m \cdot \alpha_a \cdot X) + E_R \cdot M_{RL} \dots \dots \dots (6)$$

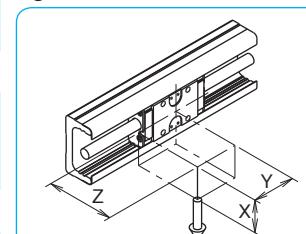

Note that the values of $(M_{PL} + m \cdot \alpha_a \cdot Z)$ and $(M_{YL} + m \cdot \alpha_a \cdot X)$ will be treated as 0 (zero) when the calculated value is negative.

iii) during deceleration (P_{Td})

$$P_{Td} = \frac{1}{1.19 \cdot n} \cdot W + E_P (M_{PL} + m \cdot \alpha_d \cdot Z) + E_Y (M_{YL} + m \cdot \alpha_d \cdot X) + E_R \cdot M_{RL} \dots \dots \dots (7)$$

Note that the values of $(M_{PL} + m \cdot \alpha_d \cdot Z)$ and $(M_{YL} + m \cdot \alpha_d \cdot X)$ will be treated as 0 (zero) when the calculated value is negative.

Figure H-5

In case of load coming from different direction other than the direction shown in the drawing $W+m$, please contact NB.

P_{TC} : calculated load applied to a block during uniform motion (N) P_{Ta} : calculated load applied to a block during accelerating (N) P_{Td} : calculated load applied to a block during decelerating (N) n : number of blocks of BG・BH W : applied load (N) m : carrying mass (kg)

α_a : acceleration during accelerating (m/sec^2) α_d : acceleration during decelerating (m/sec^2) (the negative value)

X : distance between the center of BG・BH and the center of the carrying mass (mm) Y : distance between the center of BG・BH and the center of the carrying mass (mm) Z : distance between the center of BG・BH ballscrew and the center of the carrying mass (mm) E_P : moment equivalent coefficient in the pitching direction (refer to Table H-8)

E_Y : moment equivalent coefficient in the yawing direction (refer to Table H-8) E_R : moment equivalent coefficient in the rolling direction (refer to Table H-8) M_{PL} : applied moment in the pitching direction (N・mm) $M_{PL}=0$ (This case is not applicable)

M_{YL} : applied moment in the yawing direction (N・mm) $M_{YL}=W \cdot Y$ M_{RL} : applied moment in the rolling direction (N・mm) $M_{RL}=W \cdot Z$ *Refer to Fig. H-8 for the direction of moment.

A.1.c. P_T for Vertical Movei) during uniform motion (P_{TC})

$$P_{TC} = E_P \cdot M_{PL} + E_Y \cdot M_{YL} + E_R \cdot M_{RL} \quad \dots \dots \dots (8)$$

ii) during acceleration (P_{Ta})

$$P_{Ta} = E_P(M_{PL} + m \cdot a_a \cdot Z) + E_Y(M_{YL} + m \cdot a_a \cdot X) + E_R \cdot M_{RL} \quad \dots \dots \dots (9)$$

Note that the values of $(M_{PL} + m \cdot a_a \cdot Z)$ and $(M_{YL} + m \cdot a_a \cdot X)$ will be treated as 0 (zero) when the calculated value is negative.

iii) during deceleration (P_{Td})

$$P_{Td} = E_P(M_{PL} + m \cdot a_d \cdot Z) + E_Y(M_{YL} + m \cdot a_d \cdot X) + E_R \cdot M_{RL} \quad \dots \dots \dots (10)$$

Note that the values of $(M_{PL} + m \cdot a_d \cdot Z)$ and $(M_{YL} + m \cdot a_d \cdot X)$ will be treated as 0 (zero) when the calculated value is negative.

P_{TC} : calculated load applied to a block during uniform motion (N) P_{Ta} : calculated load applied to a block during accelerating (N)
 P_{Td} : calculated load applied to a block during decelerating (N) n : number of blocks of BG · BH W : applied load (N) m : carrying mass (kg)
 a_a : acceleration during accelerating (m/sec^2) a_d : acceleration during decelerating (m/sec^2) (the negative value)
 X : distance between the center of BG · BH and the center of the carrying mass (mm) Y : distance between the center of BG · BH and the center of the carrying mass (mm)
 Z : distance between the center of BG · BH ballscrew and the center of the carrying mass (mm) E_P : moment equivalent coefficient in the pitching direction (refer to Table H-8)
 E_Y : moment equivalent coefficient in the yawing direction (refer to Table H-8) E_R : moment equivalent coefficient in the rolling direction (refer to Table H-8)
 M_{PL} : applied moment in the pitching direction ($N \cdot mm$) M_{YL} : applied moment in the yawing direction ($N \cdot mm$) M_{RL} : applied moment in the rolling direction ($N \cdot mm$) $M_{RL}=0$ *Refer to Figure H-8 for the direction of moment.

A.1.d.

Obtain the calculated load applied to a block (P_T) by calculating the average load of each motion using an appropriate equation among those shown above according to the application.

$$P_T = \frac{1}{\sqrt[3]{(S_1+S_2+S_3)}} (P_{Ta}^3 \cdot S_1 + P_{Tc}^3 \cdot S_2 + P_{Td}^3 \cdot S_3) \quad \dots \dots \dots (11)$$

 P_T : calculated load applied to one block (N) S_1 : travel distance during acceleration (mm) (refer to Figure H-7) S_2 : travel distance during uniform motion (mm) (refer to Figure H-7) S_3 : travel distance during deceleration (mm) (refer to Figure H-7) P_{Tc} : calculated load applied to one block during accelerating (N)···equation (3), (6), and (9) P_{Tc} : calculated load applied to one block during uniform motion (N)···equation (2), (5), and (8) P_{Td} : calculated load applied to one block during decelerating (N)···equation (4), (7), and (10)**B. Life of Ballscrew and Support Bearing**

The life of ballscrew and support bearing can be calculated using a common equation, as shown below. Compare the dynamic load rating of the ballscrew and the support bearing and apply smaller value for calculation.

$$L_a = \left(\frac{1}{f_w} \cdot \frac{C_a \text{ or } C_b}{P_a} \right)^3 \cdot \ell \quad \dots \dots \dots (12)$$

 L_a : rated life (km) f_w : applied load coefficient (refer to Table H-7) C_a : basic dynamic load rating of the ballscrew (N) C_b : basic dynamic load rating of the support bearing (N) P_a : axial load (N) ℓ : ballscrew lead (mm)**B.1. Calculation of P_a**

Before calculating the life using the equation (12), calculate P_a with acceleration taken into consideration. Calculate the load in each axial direction during uniform motion, acceleration, and deceleration and the obtained value is used as P_a .

Figure H-6

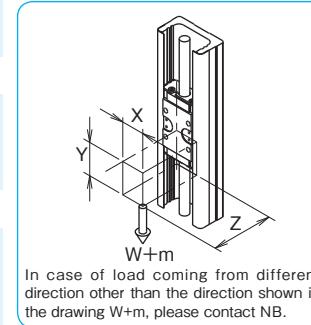

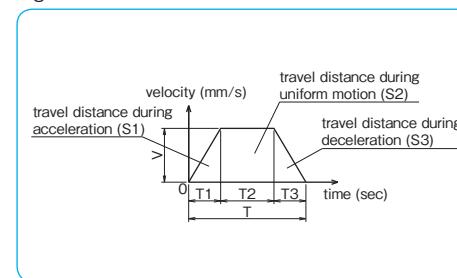

Figure H-7

**B.1.a. For Horizontal Move**i) during uniform motion (P_{ac})

$$P_{ac} = \mu \cdot W + F + f_b \cdot n \quad \dots \dots \dots (13)$$

ii) during acceleration (P_{aa})

$$P_{aa} = \mu \cdot W + F + f_b \cdot n + (m + m_b \cdot n) \cdot a_a \quad \dots \dots \dots (14)$$

iii) during deceleration (P_{ad})

$$P_{ad} = \mu \cdot W + F + f_b \cdot n + (m + m_b \cdot n) \cdot a_d \quad \dots \dots \dots (15)$$

B.1.b. For Vertical Movei) during uniform motion (P_{ac})

$$P_{ac} = (m + m_b \cdot n)g + F + f_b \cdot n \quad \dots \dots \dots (16)$$

ii) during acceleration (P_{aa})

$$P_{aa} = (m + m_b \cdot n) \cdot (g + a_a) + F + f_b \cdot n \quad \dots \dots \dots (17)$$

iii) during deceleration (P_{ad})

$$P_{ad} = (m + m_b \cdot n) \cdot (g + a_d) + F + f_b \cdot n \quad \dots \dots \dots (18)$$

Table H-9 Dynamic Frictional Resistance (f_b) of a Single Block (Seal Resistance) unit: N

part number	U/W grade
BH15	2.0
BH23	2.5
BH30	2.5
BH45	7.5

part number	high (H)	precision (P)
BG15	0.8	1.8
BG20	2.3	4.9
BG26	5.4	9.8
BG33	4.4	10.2
BG46	7.4	13.3
BG55	9	16

P_{ac} : axial load rating during uniform motion (N)
 P_{ad} : axial load rating during accelerating (N)
 P_{aa} : axial load rating during decelerating (N)
 μ : friction coefficient (0.006) W : load applied to a block (N)
 F : external force (load) applied to the axial direction (N)
 f_b : sliding resistance of a single block (N) (refer to Table H-9)
 n : number of blocks of BG · BH m : carrying mass (kg)
 m_b : mass of a block of BG · BH (kg) (refer to page H-16~31 for BG type, page H-88~97 for BH type)
 a_a : acceleration during accelerating (m/sec^2)
 a_d : acceleration during decelerating (m/sec^2) (the negative value)
 g : acceleration of gravity ($9.8m/sec^2$)

B.1.c.

Obtain the average axial load (P_a) using an appropriate formula among those shown above depending on the application.

$$P_a = \frac{1}{\sqrt[3]{(S_1+S_2+S_3)}} (|P_{aa}|^3 \cdot S_1 + |P_{ac}|^3 \cdot S_2 + |P_{ad}|^3 \cdot S_3) \quad \dots \dots \dots (19)$$

 P_a : average axial load (N) S_1 : travel distance during acceleration (mm) (refer to Figure H-7) S_2 : travel distance during uniform motion (mm) (refer to Figure H-7) S_3 : travel distance during deceleration (mm) (refer to Figure H-7) P_{aa} : axial load during accelerating (N)···equation (14) and (17) P_{ac} : axial load during uniform motion (N)···equation (13) and (16) P_{ad} : axial load during decelerating (N)···equation (15) and (18)

BG TYPE

PART NUMBER STRUCTURE

Part number for BG type is described as follows.

①	②	③	④	⑤	⑥	⑦	⑧	⑨	⑩
BG	15	01	A	75	H	AO			
	02	B		100	P	A1	L	K	P△□
				125		A2	C	KN	G▲
				150		A3	J○○	LB	
				175		A4			PNP
				200		A5			
						A6			
						A7			
						RO			

①	②	③	④	⑤	⑥	⑦	⑧	⑨	⑩
BG	20	01	A	100	H	AO			
	05	B		150	P	A1	L	S	P△□
				200		A3	C	K	G▲
						A5	J○○	SN	LB
						A6			PNP
						A8			
						A9			
						AA			
						RO			

①	②	③	④	⑤	⑥	⑦	⑧	⑨	⑩
BG	26	02	A	150	H	AO			
	05	B		200	P	A1	L	S	P△□
				250		A3	C	K	G▲
				300		A5	J○○	SN	LB

				1240		RO			
						RA			
						RB			
						RC			

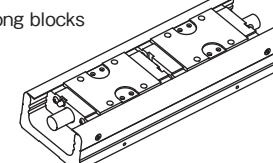

There is limitation on the length of rails depending on block type and accuracy grade.
Please refer to page H-13~14 for details.

- ① BG type
- ② size
- ③ ballscrew lead (refer to page H-12)
- ④ type of block

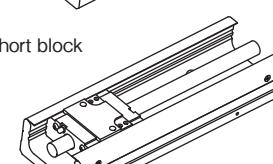

A: 1 long block

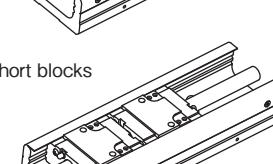

B: 2 long blocks

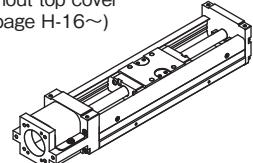

C: 1 short block

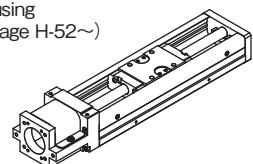

D: 2 short blocks

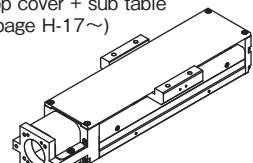

- ⑧ cover, low housing and bellows
none: without top cover
(refer to page H-16~)

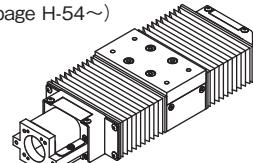

L: low housing
(refer to page H-52~)

C: with top cover + sub table
(refer to page H-17~)

J○○: with bellows
(refer to page H-54~)

○○ sensor cable outlet position
(refer to page H-54)

⑨ sensor (refer to page H-63~)

none	without sensor
S	with slim-type / compact photomicro sensor
H	with close contact capable photomicro sensor
K	with proximity sensor
SN	S Specification without sensor
HN	H Specification without sensor
KN	K Specification without sensor

SN, HN, KN are attached with sensor rail and sensor dog only.
No sensor is attached.

*Drive block is located closest to motor bracket side.

⑤ guide rail length

*Precision grade(P) has limitation on the length of rails.
Please refer to page H-14 for details.

⑥ accuracy grade (refer to page H-14)

H	high grade
P	precision grade

⑦ motor bracket (refer to page H-32~35)

The number in the square □ after suffix RA, RB or RC indicates the mounting direction code. (refer to page H-50 ~ 51)

⑩ option

none	without option
P△□	with positioning pin hole (*1)
G▲	with special grease option (*2)
LB	with low temperature black chrome treatment (*3)
PNP	with PNP sensor

In case of multiple options, add + between each option.
Example: (PS+LB+PNP)

*1: △ is S, W or R (refer to page H-75)
□ is R (refer to page H-75)

*2: ▲ is U, L or F (refer to page H-80)
Grease is applied to slide guide, ballscrew, and angular bearings.

*3: LB is applied to steel parts except for aluminum parts and radial bearings.
For BG15, LB is applied to steel parts except for the drive block, aluminum parts, and radial bearings. Black chrome treatment is applied to the drive block.

SPECIFICATIONS

BG Type is categorized as either high grade (H) or precision grade (P).
Precision grade(P) has limitation on the length of rails. (Please refer to page H-14.).

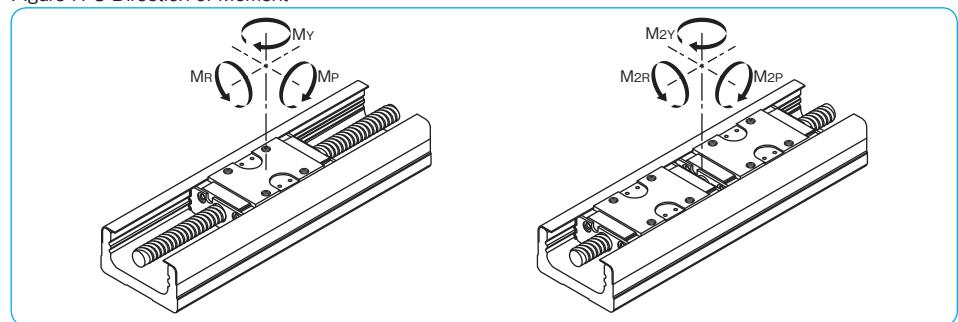

Table H-10 Specifications

Please consult with NB when using BG15, BG20 and BG26 series in the Precision grade with short and frequent stroke. (short stroke: BG1501= 2mm or less, BG1502= 4mm or less, BG2001= 7mm or less, BG2005= 25mm or less, BG2602= 14mm or less and BG2605= 25mm or less)

- M_{2P}, M_{2Y} and M_{2R} are the allowable static moments when 2 blocks are used in close contact.
- Short blocks are not available for BG3320.

Figure H-8 Direction of Moment

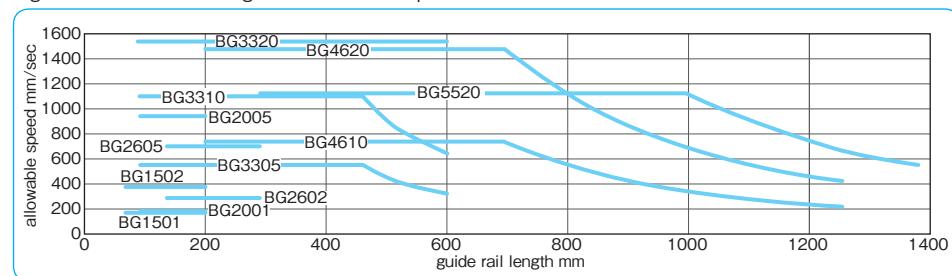

ALLOWABLE SPEED AND STROKE LIMIT

Allowable speed of BG type is subject to the type of motor and operating conditions. The speed may also be limited by the critical speed of the ball screw. Use caution when operating at high speeds or using long rails.

Table H-11 Allowable Speed and Stroke Limit

part number	rail length	stroke limit (mm)				allowable speed (mm/sec)
		1 long block	2 long blocks	1 short block	2 short blocks

Above values are measured by using our selected motors.

*Above specifications are based on using NB standard grease. Other grease may cause deviations.

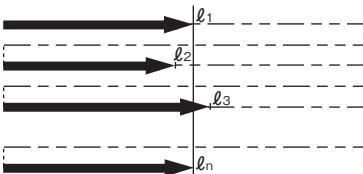

The values in the parentheses are positioning repeatability when used with return pulley unit.

Positioning Repeatability

After setting an arbitrary position, from one end, move the drive block to this position and measure the stop position. Repeat the positioning and measurement process 7 times with respect to the setting position at the midpoint and near both ends of travel. Take the maximum difference and divide it by 2, then indicate it with a positive and negative sign as the test result.

$$\text{positioning repeatability} = \pm \frac{1}{2} (\text{maximum value of } \ell_n - \text{minimum value of } \ell_n)$$

Figure H-10 Positioning Repeatability

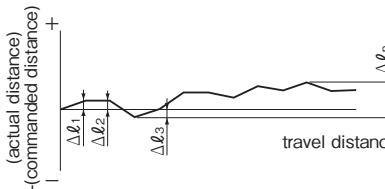

Positioning Accuracy

Positioning is performed in one direction and the resulting position is set as the datum point. Take the difference between the actual travel distance and the commanded travel distance from the datum point. Continuing in the same direction (without returning to the start point) repeat this process randomly several times until nearing to the stroke limit. Express the accuracy by the absolute maximum difference.

$$\text{positioning accuracy} = (\Delta \ell_n)_{\text{max}}$$

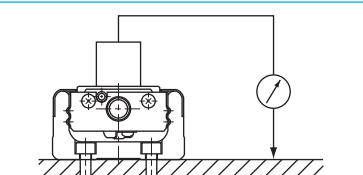

Figure H-11 Positioning Accuracy

Running Parallelism B

After fixing the guide rail onto the surface plate, placing the dial test indicator on the center of the slide block and connecting the indicator probe onto the mounting surface, run the block over the entire travel distance. Take the maximum deviation in readings as the test result.

Figure H-12 Running Parallelism B

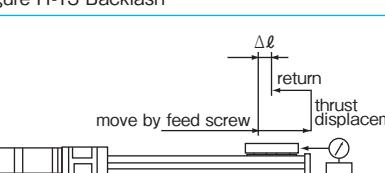

Backlash

Using the feed screw to move the slide block a little, take the dial test indicator reading and make it the datum point. While in this position, thrust the block by a certain force in the same direction without using the feed screw. Release the thrust and read the return, then take the difference from the datum point. Repeat the same process at the midpoint and near both ends of travel. Take the maximum difference as the test result.

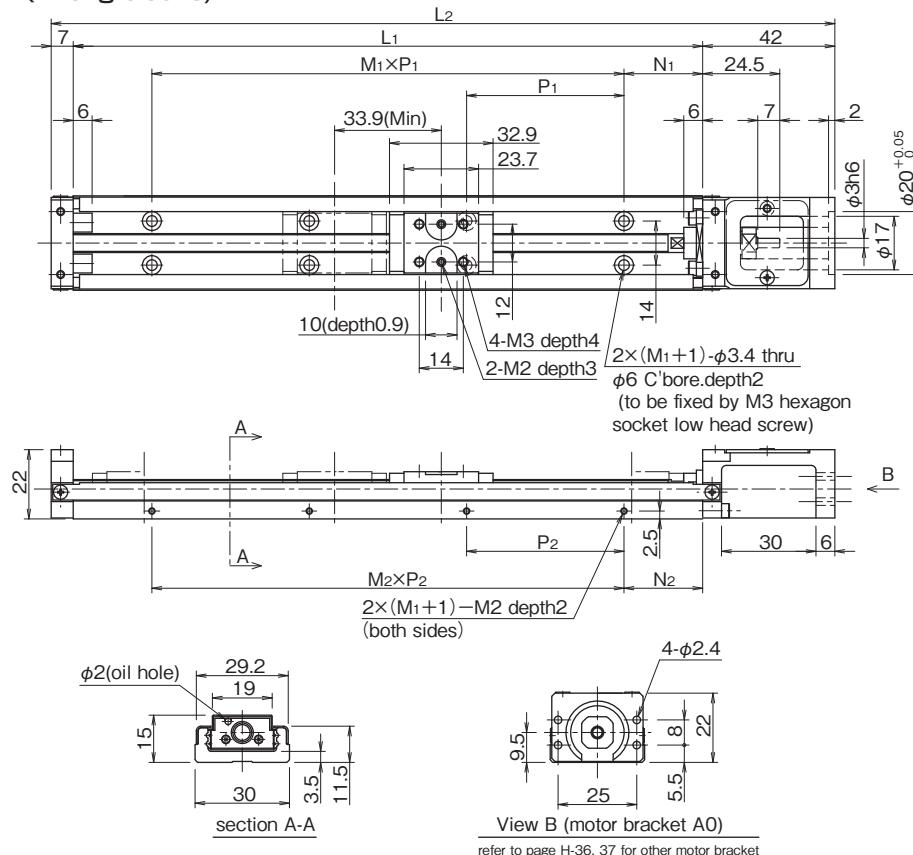

$$\text{Backlash} = \Delta \ell$$

Figure H-13 Backlash

BG15 -Without Top Cover-

A(1 long block)
B(2 long blocks)

*1: Stroke limit is a drive distance between both ends of the dampers.

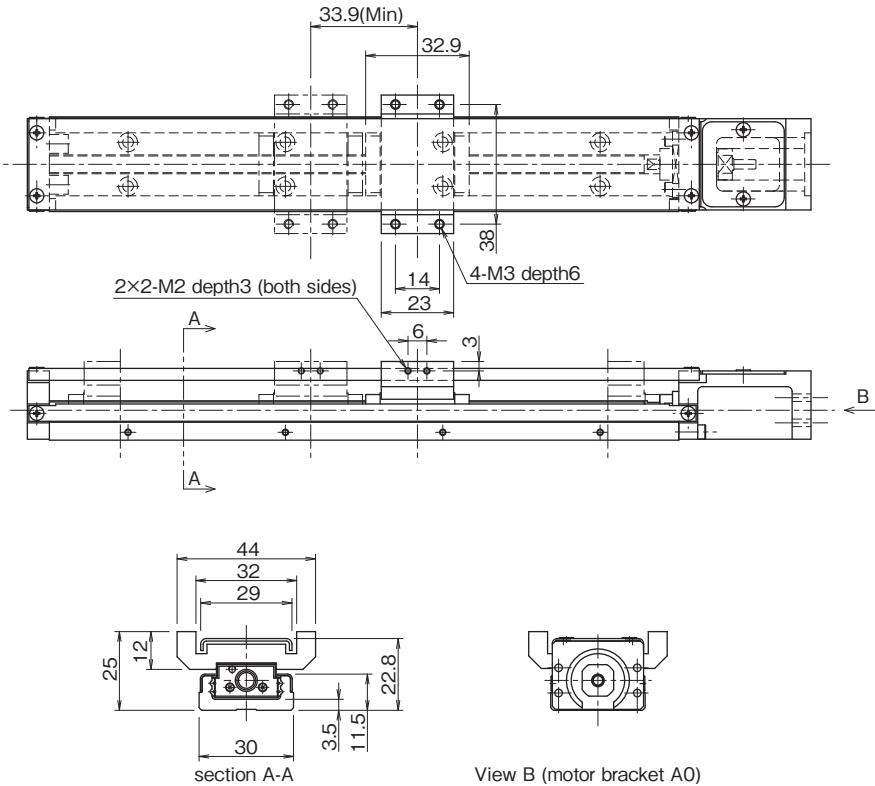

*2: Mass stated "with top cover" includes mass of sub tables.

*3: For B type (2 long blocks), drive block is located closest to motor bracket side.

*4: □ is ballscrew lead.

*1: Stroke limit is a drive distance between both ends of the dampers.

*2: Mass stated "with top cover" includes mass of sub tables.

*3: For B type (2 long blocks), drive block is located closest to motor bracket side.

*4: □ is ballscrew lead.

*1: Stroke limit is a drive distance between both ends of the dampers.

*2: Mass stated "with top cover" includes mass of sub tables.

*3: For B type (2 long blocks), drive block is located closest to motor bracket side.

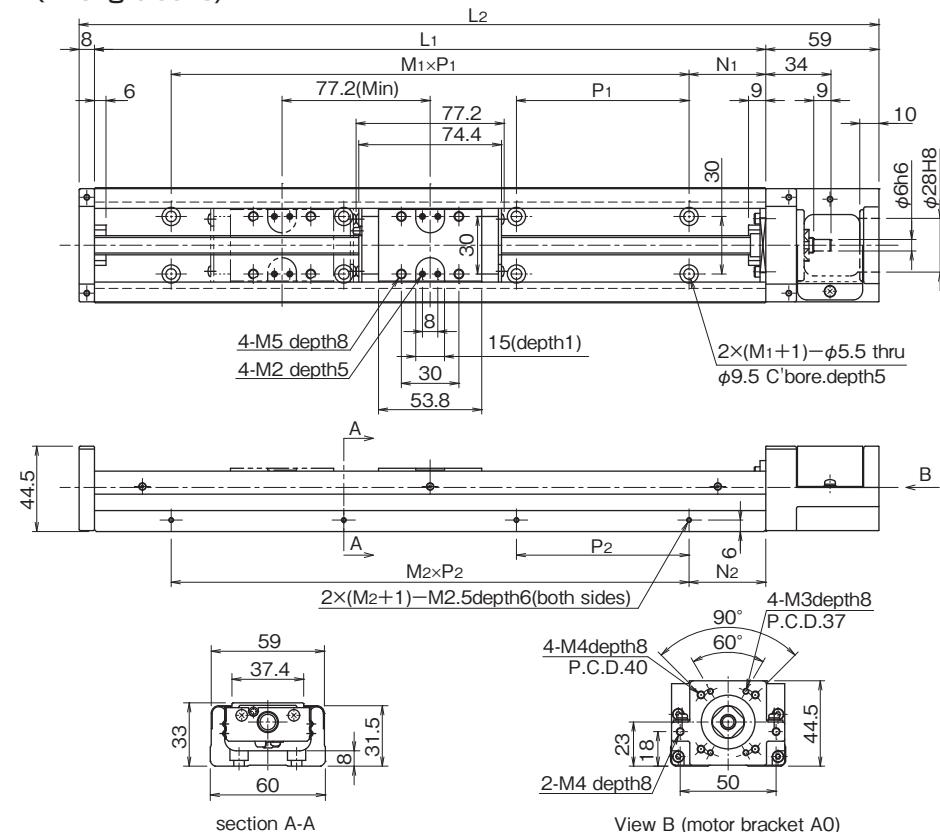

*4: □ is ballscrew lead.

BG55

Mass is 0.3kg less than the mass in the table on page H-30.

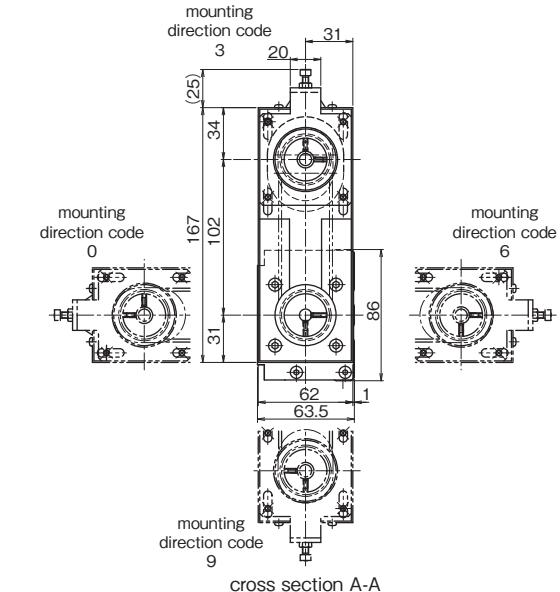

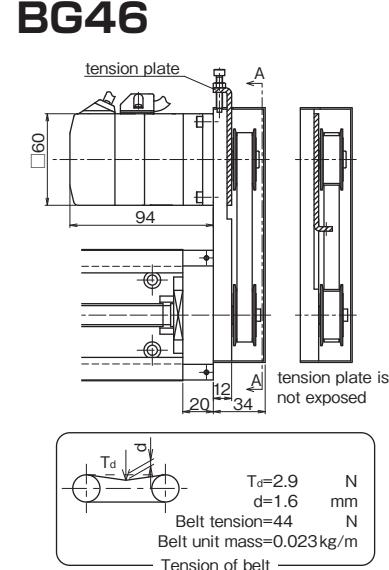

RETURN PULLEY UNIT

Return pulley units in which a motor is connected with a timing belt are available for BG type. Its return structure allows the reduction of total length (available for BG33 and BG46).

BG33

BG46

1. This drawing shows RA for MSMA01(Panasonic).

2. Installation position of Pulley Unit can be selected at 90° intervals (mounting direction code).

3. Applicable with cover and with sensors.

Precaution for applying H type sensors

When the motor is positioned at direction 3 or 9, H type sensors interfere if mounted on the side of motor.

H type sensors must be mounted opposite to the motor.

4. Tension plate can be built in and is not exposed. (not applicable to RC)

5. 0.2kg is added to the mass on page H-22 ~ 25.

6. Inertia is added $2.22 \times 10^{-6} \text{kg} \cdot \text{m}^2$ to the value of Table on page H-22 ~ 25. (motor inertia not included)

Return pulley units are available for sizes other than BG33 and BG46. Please contact NB.

LOW HOUSING

NB provides low housing with actuators. The height of housing is lower than the block. When the length of workpiece exceeds the guide block, it will interfere with standard housing. It is recommended to take low housing when long work is mounted.

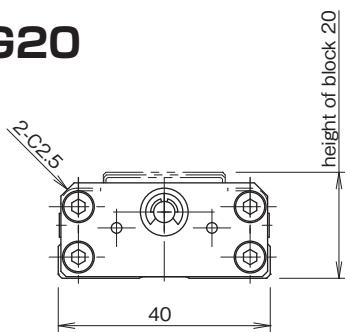

Please note that the height of motor bracket cannot be lower any more.

BG15

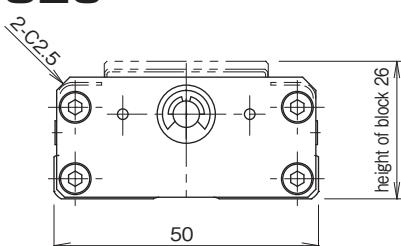

• Mass is 0.005kg less than the mass on page H-16.

BG55

• Mass is 0.1kg less than the mass on page H-30.

BELLOWS

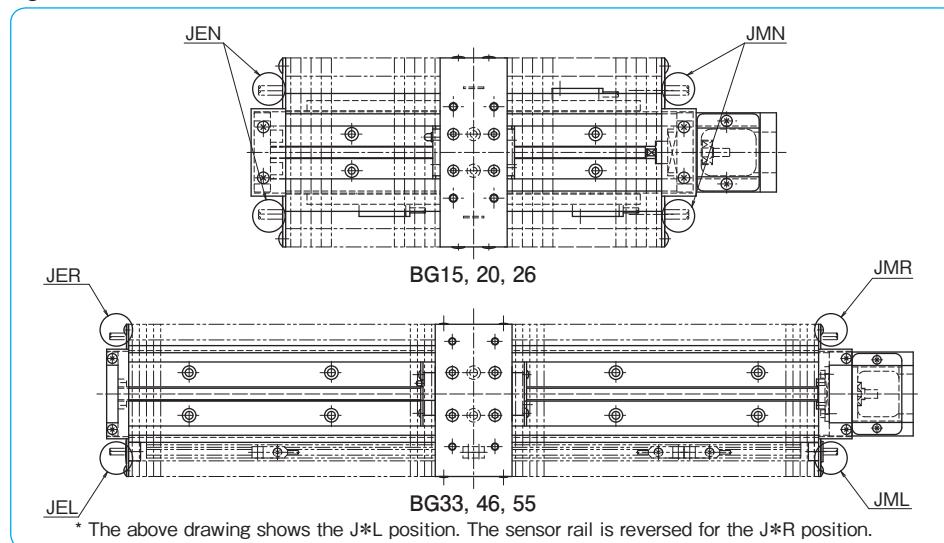

BG type can be specified with a cover or bellows for dust prevention. Bellows are securely fixed for various installation methods in positioning and directions. Sensor for bellows is limited to K (proximity sensor) type only, which is pre-installed at proper positions.

Please pay attention to the stroke limit of BG with bellows that is shorter than the standard stroke limit.

– Position of Sensor Cable Outlet –

The positions of the outlet for sensor cables can be selected as Figure H-14 shows.

Figure H-14 Position of Sensor Cable Outlet

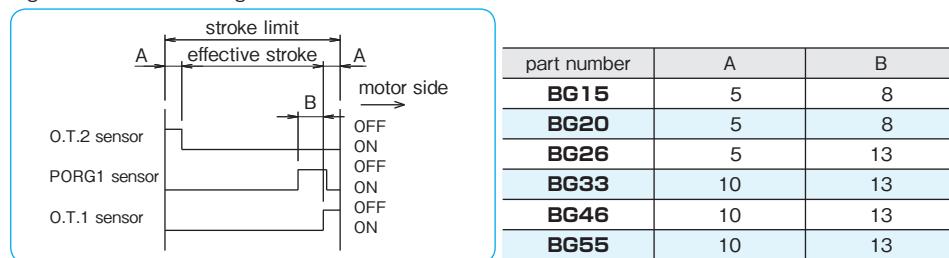

part number structure for bellows

1. J (for the first symbol)
2. Specification of the position of the sensor cable outlet
Please select the motor side or the housing side.
M: motor side E: housing side (end plate side)
3. Specification of the position of the sensor rail
Please select the right hand or the left hand.
R: on the right from the motor side
L: on the left from the motor side
*N for BG15, 20, and 26 since the sensors are mounted on both the right and left hand.
4. JNN for without sensors
5. Sensor type is K (proximity sensor) type only (APM-D3 series: Azbil).

SENSOR

Photomicro sensor or proximity sensor can be attached to the BG actuator with our optional sensor-mounting rail (the same length as the guide rail length). Tapped holes are machined on both sides of the guide rail, allowing attachment of sensor to either side. Standard positioning (without special instruction from customer) would be to the left of the motor mount end. Sensor option includes the items that are listed below.

Three types of sensor rail are available. (see Figure H-16) For details, please refer to page H-63~73. Depending on sizes, some sensor rail are not available.(See Figure H-16)

Table H-17 NPN Sensor

⁴: different frequency type

POSITIONING PIN HOLE

For the BG type, positioning pin holes can be provided on the slide block and sub table by adding the option code "PS" or "PW" in the end of the part number.

The option code "PR" is used to provide the guide rail with positioning pin holes. When positioning pin holes are necessary on both the slide block/sub table and guide rail, please add the option code "PSR" or "PWR".

Table H-19 Chart for Positioning Pin Hole

Positioning Pin Hole for Slide Block and Sub Table

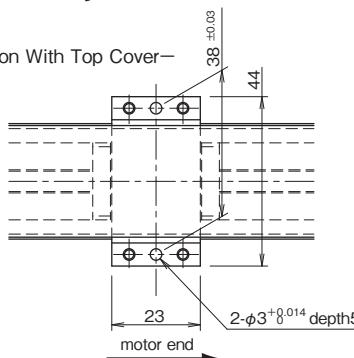

It is useful when exacting reassembly positioning is required. In case of two blocks used, both blocks are processed.

When the code "PS" is specified, the drilling hole is processed only on the mounting surface (slide block or sub table). When the code "PW" is specified for a BH with a top cover, the slide block and sub table are connected by the straight pins at the location where the "PS" option specifies on the slide block.

Note that NB does not supply straight pins for the "PS" option. Also NB can provide positioning pin holes with bellows. Please contact NB for details.

BG15A,B (long block)

**POSITIONING PIN HOLE FOR GUIDE RAIL**

It is useful to use positioning pin holes on the guide rail when exacting reassembly positioning is required.
NB does not supply straight pins. (JIS B1354-1988 parallel pin type A is recommended.)

After the insertion of the straight pins in the guide rail base, the pins might interfere with the slide block. In the positioning process, please consider the base thickness. The length of the pin in the base shall be shorter than the base thickness. Please make sure that the pins shall not interfere with the slide block.

Figure H-17 Positioning Pin Hole Location

LUBRICATION

● BG type contains a lithium soap based grease. (Multemp PS No.2, KYODO YUSHI) Apply similar type of grease for the lubrication as required depending on the operating conditions.

● Use the grease fitting to lubricate the slide block. For ball screw portion apply grease directly to the surface of screw shaft.

BG15 slide block has $\phi 2$ mm oil holes instead of grease fitting.

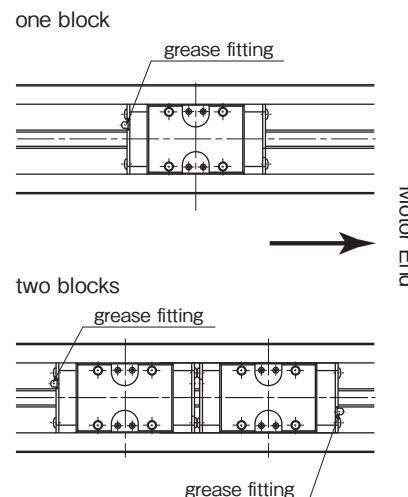

● Unless otherwise instructed, a grease fitting is located as shown in Figure H-18.

● The grease can be changed to a high function type by adding a special grease option at the end of the part number. Please refer to Table H-21 for the grease type. Also refer to page Eng-40 for further details.

Table H-21 Applicable Grease

grease option	features	product name
none (standard)	—	Multemp PS No.2 (KYODO YUSHI)
GU	urea-type low dust generation grease; low sliding resistance	KGU Grease
GLA	lithium-type low dust generation grease	KGLA Grease
GF	urea-type anti-fretting grease	KGF Grease

Figure H-18 Location of Grease Fitting

Two Axes Combined Bracket

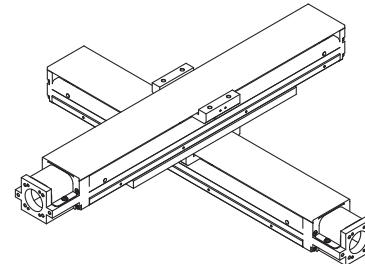

NB provides optional brackets to combine two axes for BG20, 26, 33, 46 series. Each axis is available with one long block with top cover type only. Other combination can be available, please contact NB for details.

Combination Examples

Horizontal - Horizontal

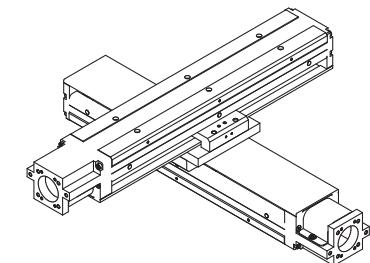

● Type A

Upper Axis: Fixed Rail, Moving Block

● Type B

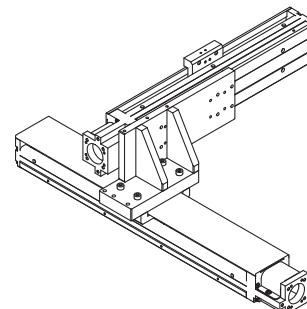

Upper Axis: Fixed Block, Moving Rail

Horizontal - Sideway

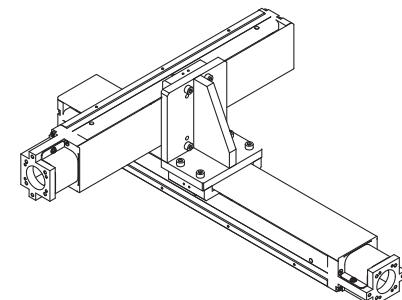

● Type C

Upper Axis: Fixed Rail, Moving Block

● Type D

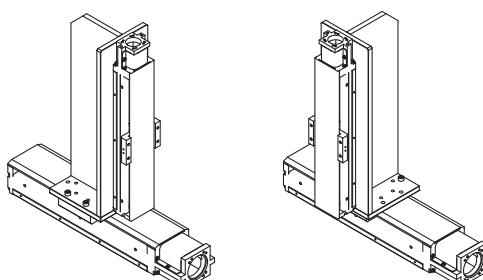

Upper Axis: Fixed Block, Moving Rail

Horizontal - Vertical

● Type E

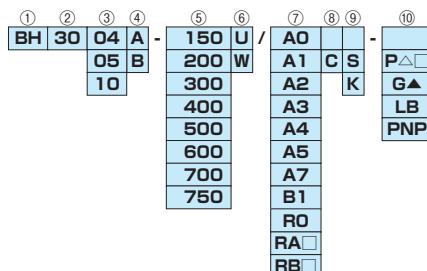

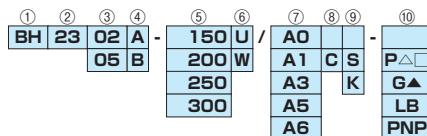

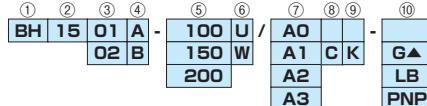

Upper Axis: Fixed Rail, Moving Block

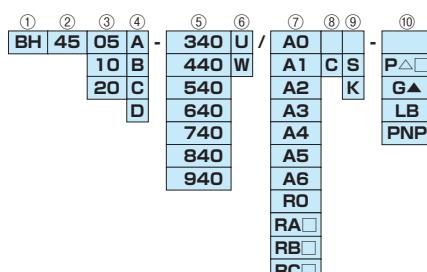

BH Type

PART NUMBER STRUCTURE

Part number for BH type is described as follows.

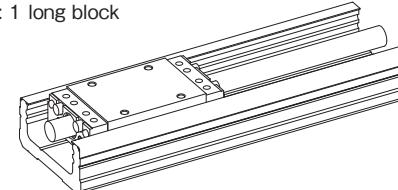

*Guide rail length 750mm is only available for BH3010.

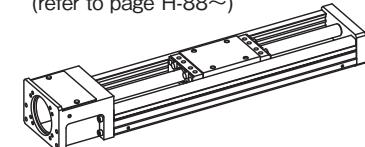

- ① BH type
- ② size
- ③ ballscrew lead (refer to page H-84)
- ④ type of block

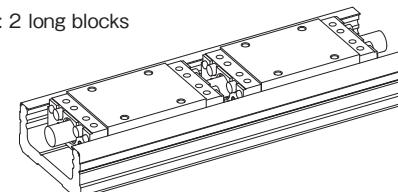

A: 1 long block

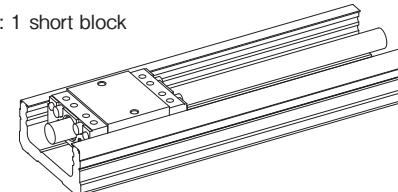

- ⑧ cover
- none: without top cover
(refer to page H-88~)

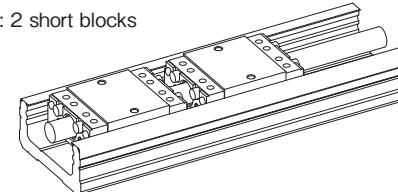

B: 2 long blocks

C: 1 short block

D: 2 short blocks

- ⑨ sensor (refer to page H-111~)
- none without sensor
- S with slim-type / compact photomicro sensor
- K with proximity sensor

- ⑩ option
- none without option
- P△□ with positioning pin hole (*1)
- G▲ with special grease option (*2)
- LB with low temperature black chrome treatment (*3)
- PNP with PNP sensor

In case of multiple options, add + between each option.
Example: (PS + LB + PNP)

*1: △ is S, W or R (refer to page H-118)

□ is R (refer to page H-118)

*2: ▲ is U, L or F (refer to page H-122)
Grease is applied to slide guide, ballscrew, and angular bearings.

*3: LB is applied to steel parts except for aluminum parts and radial bearings.

*Drive block is located closest to motor bracket side.

⑤ guide rail length

⑥ accuracy grade (refer to page H-86)

U	positioning repeatability $\pm 5\mu\text{m}$
W	positioning repeatability $\pm 10\mu\text{m}$

⑦ motor bracket (refer to page H-98, 99)

The number in the square □ after suffix RA, RB or RC indicates the mounting direction code.
(refer to page H-108, 109)

SPECIFICATIONS

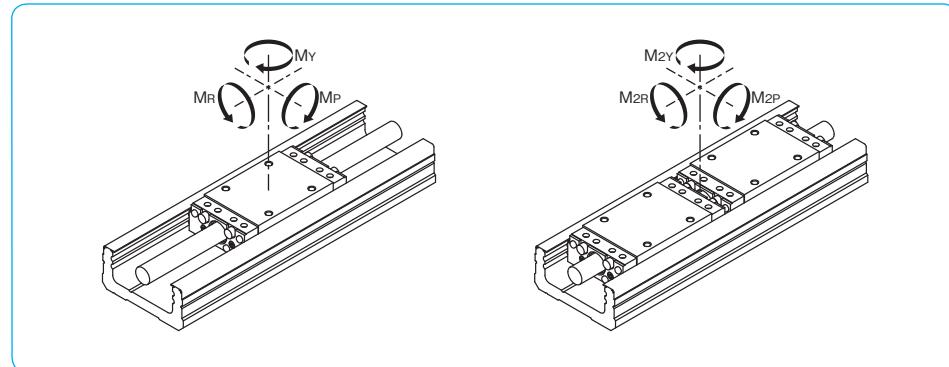

BH Type is categorized as either positioning repeatability $\pm 5\mu\text{m}$ (U) or positioning repeatability $\pm 10\mu\text{m}$ (W).

Table H-22 Specifications

M_{2P}, M_{2Y} and M_{2R} are the allowable static moments when 2 blocks are used in close contact.

Figure H-19 Direction of Moment

ALLOWABLE SPEED AND STROKE LIMIT

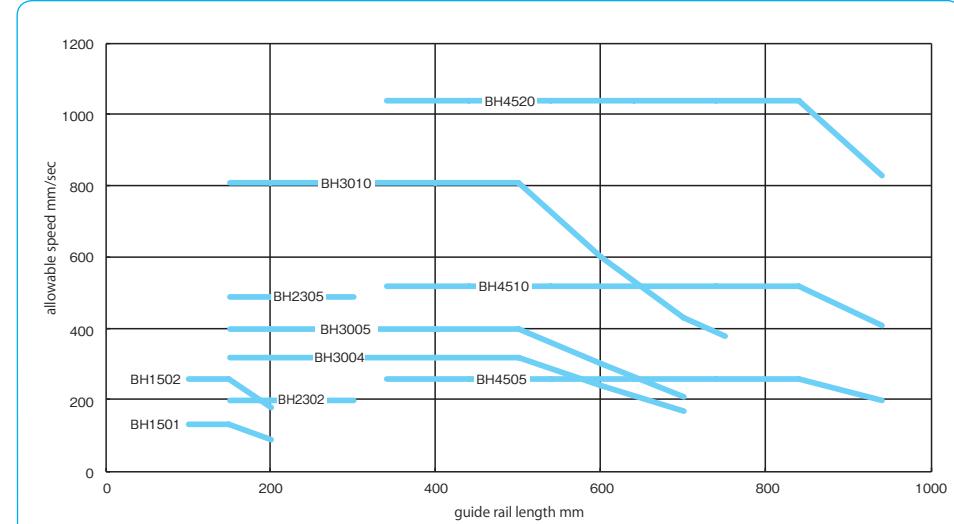

Allowable speed of BH type is subject to the type of motor and operating conditions. The speed may also be limited by the critical speed of the ballscrew. Use caution when operating at high speeds or using long rails.

Table H-23 Allowable Speed and Stroke Limit

part number	rail length	stroke limit (mm)				allowable speed (mm/sec)

	700			120													
	750			130													
	340			95		35	20	5	0.1	0.2							
BH45	440			100													
	540			110													
	640			120													
	740			130													
	840			150		40	20	5	0.1	0.2							
	940			170													

Above values are measured by using our selected motors.

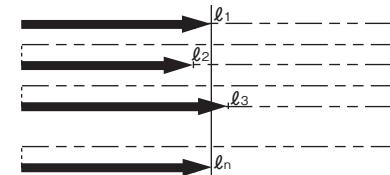

*Above specifications are based on using NB standard grease. Other grease may cause deviations.

Positioning Repeatability

After setting an arbitrary position, from one end, move the drive block to this position and measure the stop position. Repeat the positioning and measurement process 7 times with respect to the setting position at the midpoint and near both ends of travel. Take the maximum difference and divide it by 2, then indicate it with a positive and negative sign as the test result.

$$\text{Positioning Repeatability} = \pm \frac{1}{2} ((\text{maximum value of } \ell_n) - (\text{minimum value of } \ell_n))$$

Figure H-21 Positioning Repeatability

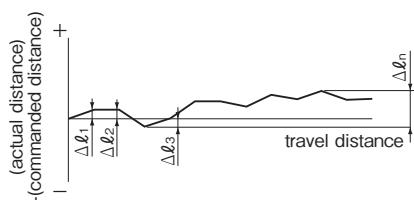

Positioning Accuracy

Positioning is performed in one direction and the resulting position is set as the datum point. Take the difference between the actual travel distance and the commanded travel distance from the datum point. Continuing in the same direction (without returning to the start point) repeat this process randomly several times until nearing to the stroke limit. Express the accuracy by the absolute maximum difference.

$$\text{Positioning Accuracy} = (\Delta \ell_n)_{\max}$$

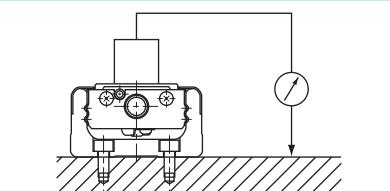

Figure H-22 Positioning Accuracy

Running Parallelism B

After fixing the guide rail onto the surface plate, placing the dial test indicator on the center of the slide block and connecting the indicator probe onto the mounting surface, run the block over the entire travel distance. Take the maximum deviation in readings as the test result.

Figure H-23 Running Parallelism B

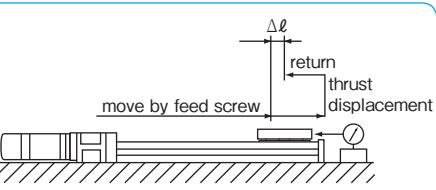

Backlash

Using the feed screw to move the slide block a little, take the dial test indicator reading and make it the datum point. While in this position, thrust the block by a certain force in the same direction without using the feed screw. Release the thrust and read the return, then take the difference from the datum point. Repeat the same process at the midpoint and near both ends of travel. Take the maximum difference as the test result.

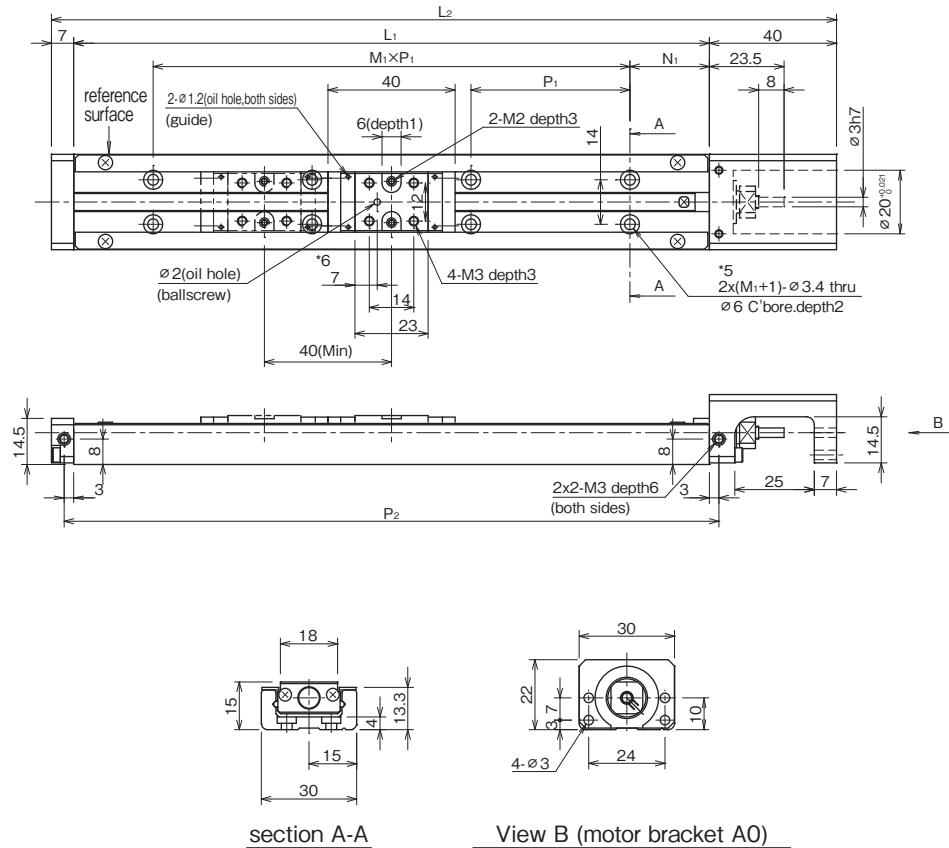

$$\text{Backlash} = \Delta \ell$$

Figure H-24 Backlash

SENSOR

Photomicro sensor or proximity sensor can be attached to the BH actuator with our optional sensor-mounting rail (refer to Table H-29). Tapped holes are machined on both sides of the guide rail, allowing attachment of sensor rail to either side. The case without special instruction from customer, standard positioning would be to the left of the motor mount end. When with two blocks, sensor dog is attached on the driving block as standard. Please change to attach sensor dog on the driven block if necessary.

POSITIONING PIN HOLE

For the BH type, positioning pin holes can be provided on the slide block and sub table by adding the option code "PS" or "PW" in the end of the part number.

The option code "PR" is used to provide the guide rail with positioning pin holes. When positioning pin holes are necessary on both the slide block/sub table and guide rail, please add the option code "PSR" or "PWR".

Table H-31 Chart for Positioning Pin Hole

Positioning Pin Hole for Slide Block and Sub Table

It is useful when exacting reassembly positioning is required. In case of two blocks used, both blocks are processed.

When the code "PS" is specified, the drilling hole is processed only on the mounting surface (slide block or sub table). When the code "PW" is specified for a BH with a top cover, the slide block and sub table are connected by the straight pins at the location where the "PS" option specifies on the slide block.

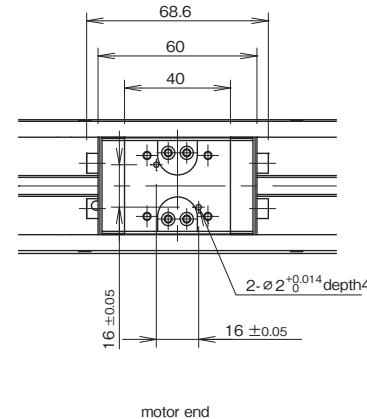

Note that NB does not supply straight pins for the "PS" option.

BH15A,B (long block)

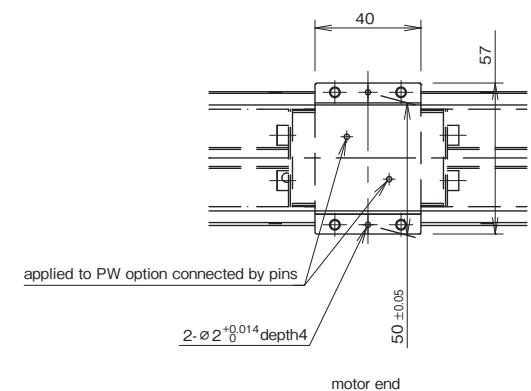

Positioning pin hole option is not available for BH15.

**POSITIONING PIN HOLE FOR GUIDE RAIL**

It is useful to use positioning pin holes on the guide rail when exacting reassembly positioning is required.
NB does not supply straight pins.

After the insertion of the straight pins in the BH guide rail base, the pins might interfere with the slide block. In the positioning process, please consider the BH base thickness. The length of the pin in the BH base shall be shorter than the BH base thickness. Please make sure that the pins shall not interfere with the slide block.

Positioning pin hole option is not available for BH15.

LUBRICATION

● BH type contains a lithium soap based grease. (Multemp PS No.2, KYODO YUSHI) Apply similar type of grease for the lubrication as required depending on the operating conditions.

● For BH23, 30 use the grease fitting to lubricate the slide block. For ballscrew portion apply grease directly to the surface of screw shaft.

BH15 slide block has φ2mm oil holes instead of grease fitting.

BH45 does not have grease fitting, apply grease directly to the raceway surface of ballscrew shaft and guide.

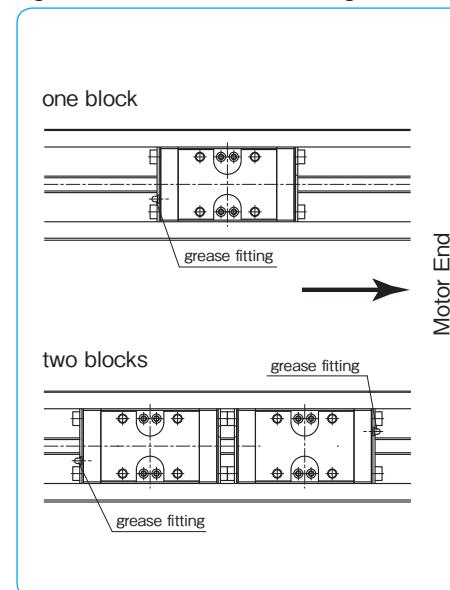

● Unless otherwise instructed, a grease fitting is located as shown in Figure H-27.

● The grease can be changed to a high function type by adding a special grease option at the end of the part number. Please refer to Table H-33 for the grease type.

Table H-33 Applicable Grease

grease option	features	product name
none (standard)	—	Multemp PS No.2 (KYODO YUSHI)
GU	urea-type low dust generation; low sliding resistance grease	KGU Grease
GLA	lithium-type low dust generation grease	KGLA Grease
GF	urea-type anti-fretting grease	KGF Grease

Figure H-27 Location of Grease Fitting

USE AND HANDLING PRECAUTIONS

● Please handle as a precision component and avoid excessive vibration or shock.

● Rough handling will affect the smooth motion and reduce the precision performance and life time.

● DO NOT DISASSEMBLE. The accuracy of BG and BH type is preadjusted before delivery.

● Please allow for extra stroke length. If the guide block repeatedly collides with damper, it may cause damage.

● Depending upon the operating environment, dust and foreign particles may contaminate actuator and disrupt the ball circulation and precision performance.

● Please never touch the area at both stroke ends during operation. There is a danger for the fingers to be caught at the stroke end. Please pay enough attention to the guide rail area even when not in operation. There is a danger for the fingers to be injured by the dust cover.

● Anti-rust oil with little affect on the lubricant is applied to the guide rail and the block top surface. When mounting it is recommended that the turbine oil (ISO standard VG32- 64) is applied to the mounting surface for antirust effect after cleaning the contact surface.

OPERATING TEMPERATURE

● Resin parts are incorporated in the BG and BH type. Please avoid using BG and BH type above 80°C. Please use the product at 55°C or lower when sensor and/or bellows are optioned.

LUBRICATION

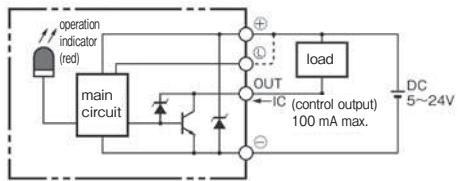

● The objective of lubrication includes the reduction of friction among the rolling elements as well as between the rolling elements and the raceway, prevention of sintering, reduction of wear, and the prevention of rust by forming a film over the surfaces. Please relubricate periodically depending on the operating conditions. The recommended relubrication interval is either of earlier period of about 6 months (3 months in case of 24 hours operation) or 1,000km of travel distance under normal conditions.

SLIDE SCREW

SLIDE SCREW

STRUCTURE AND ADVANTAGES	I-2
SIZE SELECTION	I-3
INSTALLATION	I-6
USE AND HANDLING PRECAUTIONS	I-6
SPECIAL REQUIREMENTS	I-6
DIMENSION TABLE	I-7

SLIDE SCREW

The NB slide screw converts rotational motion into linear motion by utilizing the friction between radial ball bearings and a shaft. This simple mechanism eases maintenance and installation work. The slide screw is most commonly used as transport devices in many types of machines, and is not intended for accurate positioning requirements.

STRUCTURE AND ADVANTAGES

The NB slide screw consists of two aluminum blocks, each with three radial ball bearings with a fixed angle between them. A round shaft is inserted between the two blocks, and its rotation produces linear motion determined by the contact angle between the shaft and the bearings. For variable loads, the thrust is adjusted by turning the spring loaded thrust adjustment bolts.

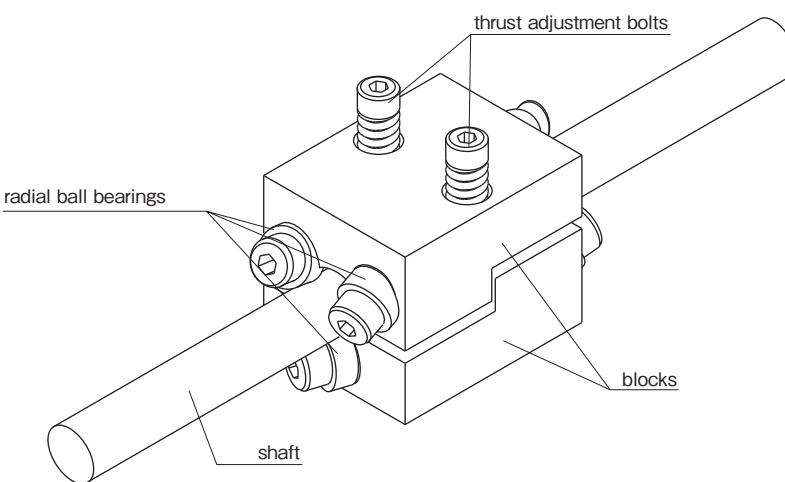

Linear Motion on Round-shaft

The NB slide screw is suitable for long-stroke applications using a standard linear shaft.

High Machine Efficiency

The slide screw utilizes the rotational motion of the bearings and drive shaft to achieve machine efficiency as high as 90%.

Figure I-1 Structure of NB Slide Screw

SIZE SELECTION

Required Thrust

Tightening of the bolts creates a thrust force by pushing the bearings against the shaft. This results in a constant force being applied to the bearings regardless of the load.

The thrust should not be greater than required force in the application.

For the horizontal application, the frictional resistance is calculated by the following equation.

$$F_1 = \mu \cdot g \cdot W \quad \dots \dots \dots \quad (1)$$

F_1 : frictional resistance (N) μ : friction coefficient
W: mass of work (kg)
g: gravitational acceleration (9.8 m/sec²)

A sufficient safety margin should be achieved by setting $\mu = 0.01$. Also, the inertia at starting and stopping should be taken into consideration.

$$F_2 = W \frac{dv}{dt} \quad \dots \dots \dots \quad (2)$$

F_2 : inertia (N) W: mass of work (kg)
 dv/dt : acceleration (9.8m/sec²)

Therefore, the required thrust is its maximum at starting point due to the combination of frictional resistance and inertia.

$$F = F_1 + F_2 \quad \dots \dots \dots \quad (3)$$

F: thrust (N) F_1 : frictional resistance (N) F_2 : inertia (N)

Rated Life

The rated life is expressed in terms of the number of revolutions of the drive shaft by Equation (4). The corresponding total travel distance and life time are given in Equations (5) and (6) respectively.

Rated life

$$L = \left(\frac{C_F}{F} \right)^3 \cdot 10^6 \quad \dots \dots \dots \quad (4)$$

Total travel distance

$$L_s = \frac{L \cdot l}{10^6} \quad \dots \dots \dots \quad (5)$$

Life time

$$L_h = \frac{L}{60 \cdot n} \quad \dots \dots \dots \quad (6)$$

L: rated life (rev) C_F : basic dynamic load rating (thrust) (N)

F: thrust (N) L_s : travel life (km) l : lead (mm)

L_h : life time (hr) n: revolutions per min (rpm)

Table I-1 Basic Dynamic Load Rating (Thrust)

part number	C:basic dynamic load rating (thrust) (N)
SS 6	98
SS 8	294
SS10	441
SS12	588
SS13	588
SS16	784
SS20	1,080
SS25	1,470
SS30	2,160

Allowable Rotational Speed

When the rotational speed is increased and approaches the shaft resonant frequency, the shaft is disabled from further operation. This speed is called the critical speed and can be obtained by the following equation. In order to leave a sufficient safety margin, the maximum operating speed should be set at about 80% of the calculated value.

$$N_c = \frac{60\lambda^2}{2\pi L^2} \cdot \sqrt{\frac{EI \times 10^3}{\gamma A}} \quad \dots \dots \dots (7)$$

Nc: critical speed (rpm)
E: modulus of direct elasticity (N/mm²)
 γ : density (kg/mm³)
 λ : installation coefficient (refer to Figure I-3)
L: support distance (mm)
I: geometrical moment of inertia (mm⁴)
A: cross-sectional area of the shaft (mm²)

If modulus of direct elasticity is 2.06×10^5 N/mm² and density is 7.85×10^{-6} kg/mm³, the critical speed for a solid shaft is:

$$N_c = 12.2 \cdot \frac{\lambda^2}{L^2} D \times 10^6 \quad \dots \dots \dots (8)$$

Nc: critical speed (rpm)
 λ : installation coefficient (refer to Figure I-3)
L: support distance (mm) D: shaft diameter (mm)

Figure I-2 Critical Speed and Support Distance

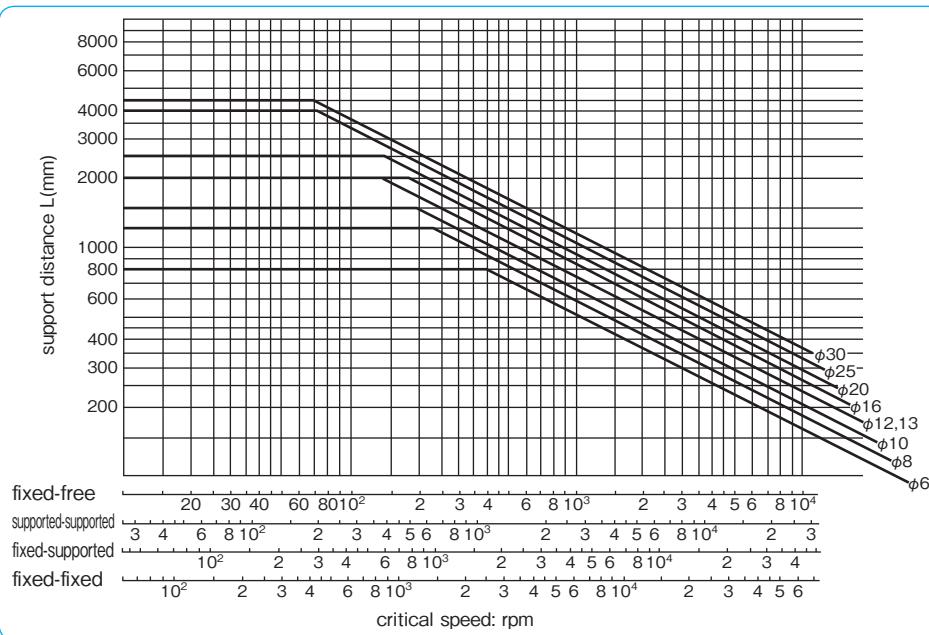

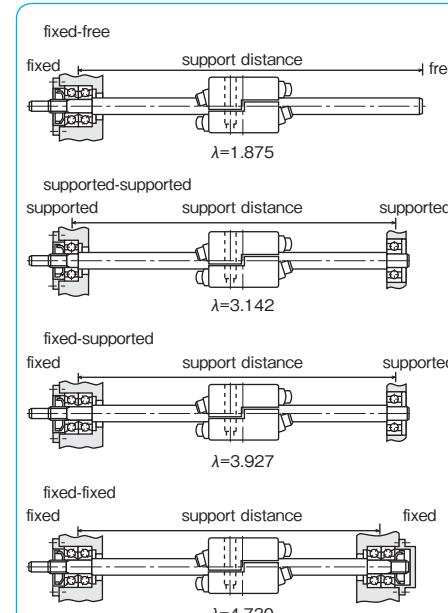

Figure I-3 Mounting of Slide Screw

Calculation Example

1. Selecting a slide screw that satisfies the following conditions:

Support method: fixed-supported

Support distance: 1,500 mm

External force: 98 N

Table mass: 50 kg

Stroke distance: 1,200 mm

Friction coefficient: 0.01

Maximum speed of transfer: 12 m/min

Cycles per minute: 4

● Determination of required thrust:

$$F = 98 + (0.01 \times 50 \times 9.8) = 102.9 \text{ N}$$

Therefore, based on the maximum thrust in the dimension table, at least SS10 is required in size.

● Allowable rotational speed:

From Equation (8), according to the conditions, the critical speed Nc is.

$$N_c = 12.2 \cdot \frac{\lambda^2}{L^2} \cdot D \times 10^6 \quad \left[\begin{array}{l} \lambda = 3.927 \\ L = 1500 \text{ mm} \end{array} \right]$$

Applying a safety factor of 0.8, the maximum speed is given by:

$$V_{max} = \frac{0.8 \cdot N_c \cdot \ell}{1000} \text{ m/min}$$

(ℓ : lead mm)

The following table summarizes the results of the calculations above for SS10 to SS16.

Table I-2 Maximum Speed

part number	shaft diameter D mm	lead ℓ mm	critical speed Nc rpm	maximum speed Vmax m/min
SS10-10	10	10	836	6.68
		15		10.0
SS12-12	12	12	1,000	9.63
		18		14.4
SS13-13	13	13	1,080	11.3
		15		13.0
SS16-16	16	16	1,330	17.1
		24		25.6

Therefore, the SS13-15 and SS16-16 slide screws satisfy the given conditions.

● Life Calculation

The life for the SS13-15 slide screw is calculated as follows. The rated life is obtained using Equation (4).

$$L = \left[\frac{C_F}{F} \right]^3 \times 10^6 = 186 \times 10^6 \text{ rev}$$

The average number of rotations that satisfies the conditions is:

$$n = \frac{1,200 \times 2 \times 4}{15} = 640 \text{ rev}$$

The life in terms of time is:

$$L_h = \frac{L}{60 \times n} = 4,840 \text{ (h)}$$

For the SS16-16 slide screw:

$$L = 4,400 \times 10^6 \text{ rev}$$

$$n = 600 \text{ rev}$$

$$L_h = 12,200 \text{ (h)}$$

2. Determining the maximum speed of transfer under the following conditions:

Support method: fixed-supported

Support distance: 2,000 mm

Slide screw selected: SS16-16

The critical speed is obtained from Equation (8):

$$N_c = 12.2 \cdot \frac{\lambda^2}{L^2} \cdot D \times 10^6 \quad \left[\begin{array}{l} \lambda = 3.927 \\ L = 2000 \text{ mm} \\ D = 16 \text{ mm} \end{array} \right]$$

Applying a safety factor of 0.8, the maximum speed of transfer is:

$$V_{max} = \frac{0.8 \cdot N_c \cdot \ell}{1000} \text{ m/min} \quad (\ell: \text{lead mm})$$

$$= 9.6 \text{ m/min}$$

INSTALLATION

1. Clean dust from drive shaft.
 2. Place shaft between upper and lower blocks.
Lightly tighten thrust adjustment bolts until the clearance between the shaft and the bearings diminishes.
 3. Temporarily attach the slide screw to the table.
 4. Adjust the parallelism between the slide screw and the linear motion guides by manually moving the table back and forth. Fix the shaft accurately after the required parallelism is achieved.

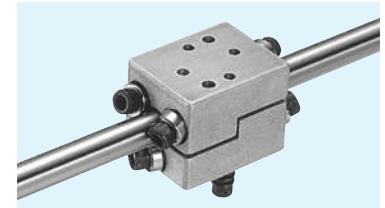

USE AND HANDLING PRECAUTIONS

- It is recommended to use a heat-treated ground shaft such as NB shaft to prevent wear and to obtain smooth motion. (refer to page F-2)
 - Since the slide screw utilizes the friction between the bearings and the shaft, the lead varies due to the effect of load variation, movement direction, and shaft conditions. As the values of standard lead are advisory, highly accurate positioning cannot be obtained by attaching a linear scale to the table.
 - If the slide screw and linear motion guides are not parallel, an unbalanced load will be applied to the slide screw. Exercise care in controlling the parallelism.

SPECIAL REQUIREMENTS

NB can fabricate slide screws to meet special requirements, including screws with a special lead or a reverse lead. Contact NB for further information.

*1 The mounting holes are machined on request.

*2 H₁ is the minimum height when the maximum thrust is applied.

*3 The values of standard lead are advisory.

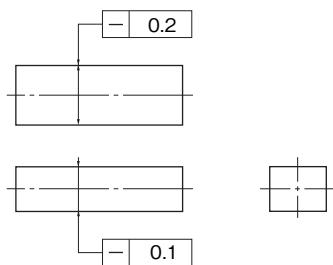

TECHNICAL REFERENCE

DEFINITIONS AND DESIGNATIONS OF GEOMETRICAL DEVIATIONS (JIS B0621)

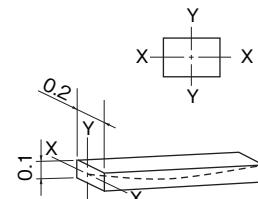

TOLERANCING OF FORM, ORIENTATION, LOCATION AND RUN-OUT (JIS B0021)

Straightness Straightness indicates the degree of deviation of a straight portion from the geometrical straight line.

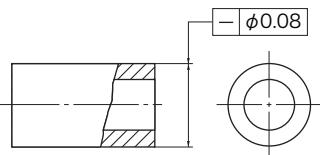

Straightness of two directions perpendicular to each other (Axis of a rectangular parallelepiped)

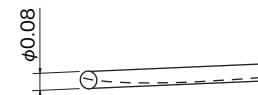

Space inside the prism enclosed by two pairs of parallel planes with intervals of 0.2mm and 0.1mm in the directions of indicated arrows

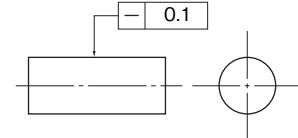

Straightness with no direction defined (Axis of a cylinder)

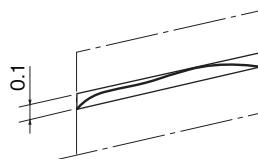

Space inside a cylinder with a diameter of 0.08mm

Straightness of a surface element (Generatrix of a cylinder)

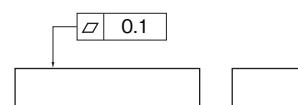

Space between a pair of parallel straight lines with an interval of 0.1mm on an arbitrary plane including the axis

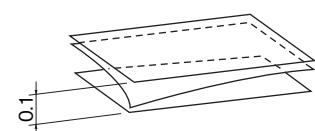

Flatness Flatness indicates the degree of deviation of a flat portion from the geometrical plane.

General flatness

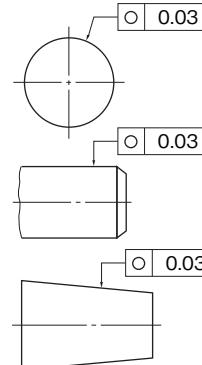

Space between a pair of parallel planes with an interval of 0.1mm

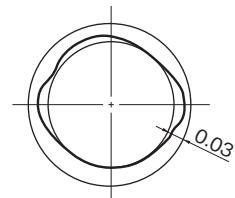

CIRCULARITY

Circularity indicates the degree of deviation of a circular portion from the geometrical circle.

Space between two concentric circles with a radius difference of 0.03mm. Applicable to an arbitrary cross section perpendicular to the axis.

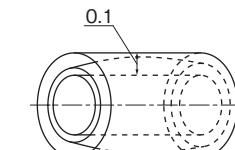

CYLINDRICITY

Cylindricity indicates the degree of deviation of a cylindrical portion from the geometrical cylindrical surface.

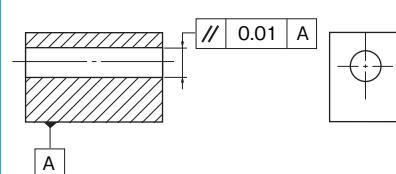

Space between two concentric cylinders with a radius difference of 0.1mm

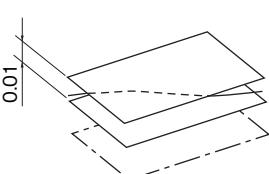

PARALLELISM

Parallelism assumes a combination of two straight portions, a straight portion and a flat portion, or two flat portions which must be parallel to each other. Parallelism indicates, with one of the two portions as a reference, the degree of deviation of the other straight or flat portion from the geometrical straight line or plane parallel to the reference straight line or plane.

Parallelism of a straight portion with respect to the reference plane (Axis of a hole)

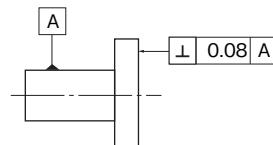

Space between two parallel planes with an interval of 0.01mm, parallel to the reference plane

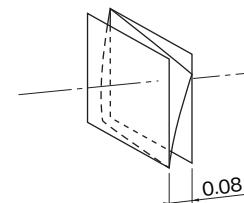

PERPENDICULARITY

Perpendicularity assumes a combination of two straight portions, a straight portion and a flat portion, or two flat portions which must be perpendicular to each other. Perpendicularity indicates, with one of the two portions as a reference, the degree of deviation of the other straight or flat portion from the geometrical straight line or plane.

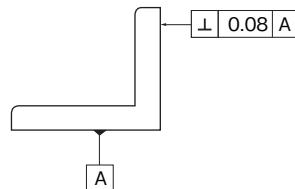

Perpendicularity of a flat portion with respect to the reference straight line
(with the axis of a cylinder as a reference)

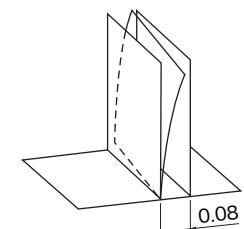

Space between two parallel planes with an interval of 0.08mm, perpendicular to the reference straight line

Perpendicularity of a flat portion with respect to the reference plane

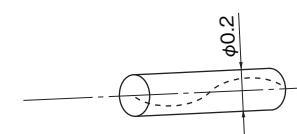

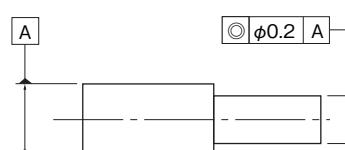

Space between two parallel planes with an interval of 0.08mm, perpendicular to the reference plane

**CONCENTRICITY**

Concentricity indicates the degree of deviation from the axis which must be on the same straight line as the reference axis.

Concentricity of a cylindrical portion

Space inside a cylinder with a diameter of 0.2mm, concentric with the reference axis
